Better Corners Prolong Fence Life

By R. U. BLASINGAME

ONE of the most common sights to be seen in a drive along any road or highway is a good fence going to rack and ruin because the corners have not been properly installed or have been made with cheap and short-lived material. Frequently can be seen fences made with steel posts, capable of lasting thirty years or more, and the corners made with wood posts or steel corners improperly set.

One reason for weak corners has been the fact that many fence builders were unwilling to take the time and energy to set the corner and brace posts in concrete, or have been unaware that the corner is the most important part of the fence. A fence will not remain stretched tight if the corners are weak, or if they have been hurriedly installed and are consequently heaved by frost every winter. A fence which is not kept stretched tight will thus have its useful life greatly shortened.

There are two satisfactory methods of making good corners with steel fence posts. One is to set the corners and brace posts in concrete; the other is to use dirt-set corner assemblies which have recently been developed to provide great strength cheaply and without the extra work and expense of concrete. These assemblies provide wide expanding anchor plates on the bottom of the corner post and broad

Drive the brace plate into solid ground.

The brace plate is now fastened to the end of the brace rod and driven into the solid ground. Do not dig a hole for the plate, as firmer bearing can be secured against undisturbed soil. Remove the soil under the brace just wide enough for the brace and continue driving until the top of the plate is two or three inches below the surface of the ground. Cover the brace plate and the post is ready for stretching fence.

High Efficiency Hydraulic Rams

SOMETIME ago we prepared a short article pertaining to hydraulic rams. One hydraulic ram manufacturer writes us the following:

"Our rule for figuring length of drive pipe is to divide the elevation to which the water is pumped by the ram and multiply this result by 6, but in no case is it necessary to go over 30 feet and we never go under 30 feet. All of our rams up to and including the No. 30 are hot galvanized inside and out and there is no corrosion of the inside or outside, which adds to efficiency."

"The highest proportion of water we can deliver is 45 per cent of the water used. This is where the lift is a little over twice the fall. We have ten per cent for friction of the water. A ram will not operate unless the lift is double the fall. Ram has higher efficiency when it pumps 10 or ten times the fall than when it pumps only twice the fall."

We know that this company makes a high-grade product and do not hesitate to publish their statement regarding the efficiency of their equipment.

Custom Work

WE sometimes have inquiries from readers with respect to operating custom tractor outfits for purposes other than threshing. Here is a statement from Mr. Murray Wilson, Ontario county, New York, with regard to his experience along this line, taken from a news letter from the National Association of Farm Equipment Manufacturers.

"Tractor owners who do not have enough private duties for their machines to keep them busy may be well repaid if they remember that efficiency is usually in demand."

"Earnings of Murray Wilson, with a three-plow tractor purchased in August, 1924, show the possibilities of income from custom work. In five years Mr. Wilson earned a total of \$16,738, an average of approximately \$3,347 a year. During this time his expenses for repairs on the tractor were less than \$50."

"Jobs on which the outfit was used included hay baling, wood sawing, threshing, plowing, disking, dragging, stump pulling and operating a saw mill."

The hole is dug 37 inches deep.

push plates which are a part of the brace posts and which are driven into undisturbed firm earth. Such a corner assembly is installed easily and quickly because there is only one post hole of ordinary size to dig. The accompanying illustrations show how a dirt-set corner assembly is installed.

A round hole nine inches in diameter or a square hole eight inches across is dug to allow the post to be set with brace plates folded together, as shown in first sketch. Next brace is attached to post, flat side of angle on top. With the brace as lever the post is turned to open the brace plates at bottom of post.

The next operation is to lean the top of the post backwards two inches, then fill and tamp the hole. The post will pull back to vertical position when fence is stretched. The brace rod should be pushed in the soil temporarily to hold the post backwards while it is being tamped solid.

Turn post clock-wise to open the expanding anchor plates.

PATHFINDER

a TIRE that commands respect on any car -

ENTIRELY apart from the fact that Pathfinder's other name is Goodyear, anyone can see that it is a remarkable tire.

It's big and husky—thick of tread and fat of side. You can feel the strength and toughness in its resilient black rubber—and you can prove that toughness by your speedometer on city boulevard or country road.

In addition to its obvious ruggedness, it has the extra life of that famous cord material, Supertwist, built into its carcass.

If you tried to guess the price of a Pathfinder, chances are you'd name a figure far above that which Goodyear dealers are asking. In fact, there are few tires of any kind which are sold at prices so low.

A FAMOUS NAME  A FINER CAR

Enjoy all these improvements
while you profit by Pontiac economy

NEW SERIES
PONTIAC BIG SIX

Illustrated above: The 2-Door Sedan • Body by Fisher

Farmers who drive the New Series Pontiac Big Six can look forward to years of dependable performance. For Pontiac's 60-horsepower engine—the largest in any low-priced six—has big, durable main bearings. The crankshaft is fully counterweighted and equipped with the Harmonic Balancer which counteracts torsional vibration. Full pressure lubrication provides correct, positive oiling. Because of Pontiac's moderate engine speed there is, at all times, less wear on moving parts. And many vital improvements now assure Pontiac owners an even greater degree of driving satisfaction than they have enjoyed in the past.

New rubber engine supports which insulate the power plant from the frame make Pontiac's engine much smoother. Its big, weather-proof, non-squeak four-wheel brakes have been made still more positive and reliable. A smart new sloping windshield, affording maximum vision, also deflects headlight glare. A new roller bearing steering mechanism gives increased ease

of control. Improved Lovejoy Hydraulic Shock Absorbers at no extra cost, and more flexible front springs, provide the car riding ease.

And while you enjoy these and many other improvements, you will also profit by Pontiac's traditional economy. For the New Series Pontiac Big Six is just as inexpensive to maintain as earlier Pontiacs. It gives the same remarkably high mileage from gasoline. Oil consumption is low. Repair bills are few. And because of its long life, Pontiac's resale value is always unusually high.

The New Series Pontiac Big Six is on display at the showrooms of your Oakland-Pontiac dealer. Stop in and let him tell you more about this exceptional automobile. See its bodies by Fisher. Notice its new Duco colors. Careful investigation and a trial ride will reveal the many advantages of Pontiac ownership. . . . Available in seven body types. All prices f.o.b. Pontiac, Mich., plus delivery charges. . . . Oakland Motor Car Company

Write for an interesting booklet which illustrates and describes the design of the New Series Pontiac Big Six with its important improvements.

Remember . . . you can buy a Pontiac on special G. M. A. C. terms offered to farm buyers exclusively with payments at convenient intervals during the year.

AND UP, F. O. B. PONTIAC, MICHIGAN

One less chore to do on the farm

FOR big game, small game, pests that steal your grain and poultry—for all kinds of shooting—the right cartridges are Kleanbore. They're more accurate, and they do one of your disagreeable chores for you.

Kleanbore cartridges prevent rust, corrosion, pitting and leading. They keep the rifle accurate, and relieve you of that tiresome churning with the cleaning rod.

More Kleanbore .22's are sold than all other makes combined, and they're only four years old. That tells the story of their superiority. And they're just as good in all sizes for rifles and revolvers, rim fire and center fire.

Give your rifle one last thorough cleaning. Then shoot nothing but Kleanbore cartridges in it, and it'll stay as accurate as it is today, whether you clean it or not.

Your dealer sells Kleanbore. Insist on getting it.

LOOK TO THE BODY!

SAFETY COMFORT • BEAUTY emphasized in every Body by Fisher . . .

Left—More and more men and women are directing their attention to the motor car body. When this is done, the rich materials and careful craftsmanship make Fisher Body cars stand out as far superior by contrast.

Left—Fisher provides for the absolute comfort of the driver by the adjustable driver's seat, which can be moved easily forward or back through a range of 3 inches by turning a conveniently located regulator handle.

Below—The dotted line shown indicates the position of the conventional curved windshield. The double line shows the positioning of the new Fisher Non-glare Vision and Ventilating Windshield, which is substantially flat and reduces windshield glare to a minimum.

In every Fisher Body car, safety, comfort and beauty are developed to an exceptional degree

Safety—Fisher Body cars are safe. Among the many important attributes of safety found in Body by Fisher are the following: Wood-and-steel construction—the type of construction used in bodies for the most expensive cars; Fisher's scientific method of bracing the body at every point subject to stress and strain; the flat and low construction of the roof—this being the strongest type of roof construction; and the Fisher non-glare vision and ventilating windshield. This windshield provides clear and undistorted vision through a single pane of genuine plate glass. At the same time, it reduces the annoying reflection of windshield glare. In addition, it affords complete and thorough ventilation of the car. The windshield may be adjusted as desired by turning the regulator handle, even while the car is in motion.

Comfort—Comfort and roominess in a Fisher Body car are fully evident. An adjustable front seat, which can be moved easily forward or backward by turning a conveniently located regulator handle, enables the driver to assume the most comfortable and efficient driving position. The form-fitting cushions are resilient and comfortable, and are inclined at the right angle to afford greatest riding ease. Fine

coiled springs and thick soft padding assure resiliency coupled with strength and durability.

Beauty—Fisher Body cars are designed by the world's foremost body designers. They excel in harmony of line and color. That is why every Fisher Body car, no matter what its price, enjoys favorable comment even when compared with the costliest cars. Furthermore, Fisher Bodies are found on General Motors cars and only those cars, assuring the motor car buyer not only greater safety, comfort, beauty and body value, but far greater motor car value as well.

The Story of Woodbine Farm

By W. D. ZINN

(Continued from last week.)

CHAPTER XIII

Up to this time nothing has been said about the children in the home. On the first day of June, 1889, a son was born. We named him Dorrance Dana. On August 5, 1893, a daughter arrived who was named Gay. Dorrance from childhood was fond of books. Gay was well named. She did not dislike books, but she was more fond of play than her brother. He looked on the serious side of life, while Gay enjoyed a good time. Both these characteristics are commendable in children.

In a former chapter I had something to say about my limited opportunity for securing an education in the country schools. After thirty years, when my children entered school we had as yet but a four months' term, a one-room school house, and very poor facilities for educating our children. On account of these things as well as because of the belief that many children are put into school at too early an age, our children were not started to school until after they were past seven years of age.

College Training

Dorrance completed the work in the grades at the age of thirteen, entered high school at Philippi, and a few years later began his college work at what is now Broadus College. Graduating from there, he then took a four-year course at Bucknell University in Pennsylvania, from which school he received his degree. At this writing he is Principal of one of the ward schools in Sioux City, Iowa. He married Erma Marsh, who had been a teacher in the Philippi schools for four years. They have two children, Susan and William D.

Gay followed her brother through the grades, graduated from Broadus College, and went to the Ohio State University, from which she received a degree in Home Economics in 1917. Subsequently she accepted a position in the Extension Department of the West Virginia University, where she remained about eighteen months. Her husband, Robert B. Dustman, is also a graduate of the Ohio State University. Recently he was awarded the Ph. D. degree from the University of Chicago after which he became Chief in Agricultural Chemistry at the University of West Virginia. Previous to this time he had served for a number of years as Extension Specialist in Crops and Soils at the Ohio State University. They have two children, Robert B., Jr., and Mary Jean.

I have discharged the duty that I believe every father owes to his children, that is, I have provided them with a fairly good education. This has given them something that no one can take from them. A great many people have the idea that the world owes them a living whether they make any effort to earn it or not. We tried to teach our children that the world owed them nothing, but that they owed the world the purest and most noble and active lives they could give to it. Because of their superior advantages over their parents, the world will demand, and have a right to expect of them, more useful lives than their parents have been able to lead.

Livestock Shipping

I was so eager to make money and get out of debt that I engaged in many things in which I thought I could earn a few dollars. These efforts did not always bring success. The shipping of livestock was one business that, had I left alone, I would have had more money to spend on other things. I was in the business from 1890 to 1900 and shipped thou-

sands of sheep and cattle. All these years I had a partner in the person of I. C. Woodford. In justice to Mr. Woodford I would say that our failure to make money at this business was no more due to him than to me. He did his part well and I tried to do mine well. But in the nineties no one went ahead very rapidly financially. It is hard to buy so as to make a profit on a declining market and that was the kind we had most of the time.

I recall a carload of cattle which we bought of Mr. T. They were good butcher cattle that averaged about 1,200 pounds. We bought them for two and one-half cents per pound or \$30 a head. Mr. T. had asked me three cents for the cattle but finally agreed to sell them at two and one-half cents. We shipped the cattle, my partner going to the market with them. On his return we figured up what we had made and after paying all expenses we found that we had a profit of 86 cents on the load of cattle. They were sold in Philadelphia for three and one-fourth cents per pound. Mr. T. claimed after he had sold us the cattle that we had mesmerized him into giving us the cattle. I do not know what would have happened had he been able to mesmerize us. He never felt kindly toward us from that date forward.

Deals in Lambs

On one occasion I went to Baltimore with three loads of cattle and a single deck of lambs (135 head). The cattle market was good that week and I sold the three loads, making us \$300. The lambs were consigned to a commission man who sold them for me. When I had paid the freight and the commission I had \$70 left for the 135 lambs.

On another occasion I had bought a lot of lambs of Mr. J. at five cents per pound. We had balanced the scales and driven in a draft of lambs when there came one of the hardest downpours of rain I had ever witnessed. After the rain was over we went back to the scales. The platform was covered with water and the lambs were soaked to the skin. I suggested that the lambs be driven off while the scales were rebalanced. Mr. J. objected strenuously, weighed both lambs and water and went to the house after notifying me that he would accept settlement on no other basis.

One winter I went to Toronto, Canada, in search of stock cattle. We found none on the market that suited us. Finally we drove out into the country 60 miles with a Canadian shipper, and spent Sunday in his home. On Monday morning the thermometer was 40 degrees below zero, but we drove all day in a sleigh and by night had bought two carloads of cattle.

Sometimes we bought only one animal in a place and, although the shipping point was eight miles from them, these Canadians drove their cattle all lots of one, two, three and four all of that distance and helped us load them. I doubt whether a place could be found in the United States where the farmers would be willing to do so much.

Most Shippers Fail

Shipping livestock is a fascinating business. Very few men ever quit after they commence until they break up and most of them do fail. In the fall of 1900 we had quit shipping for the season when a friend called me up from a neighboring county saying he had a load of good cattle he wanted to sell. After he had described

(Continued on page 28.)

Uses Pyrox Instead of Home-Made Bordeaux — Gets Increased Yield

IN every potato-growing section, instead of home-made bordeaux are getting bigger yields, finer quality potatoes, and more profits. The extra yield obtained with Pyrox more than pays for the cost of spraying and leaves extra cash besides. Mr. A. J. Meyer of Annville, Pa., writes:

Mr. A. J. Meyer of Annville, Pa.

"Last spring I decided to make a comparison of Pyrox and home-made bordeaux sprays so I put on one-acre tests for each material.

"At digging time in September accurate measurements of the land and weights of the potatoes were made. The potatoes sprayed with Pyrox yielded 287 bushels per acre, and where the home-made bordeaux was used 241 bushels per acre. This was a gain of 46 bushels to the acre for Pyrox, a substantial increase. This gain pays the spray material bill and leaves a profit.

"All conditions for the two plots were the same in every respect and I believe that the Pyrox spray is responsible for the increased yield."—A. J. MEYER.

If you have not used Pyrox try it this year. Pyrox is a combined insecticide and fungicide that kills insects, prevents blight, and other plant diseases, and stimulates plant growth.

Quick and easy to use. It does not clog the nozzles and sprays in a fine mist. It has excellent sticking and covering properties.

Spraying with Pyrox not only results in the extra yields normally expected from spraying—the user can anticipate a still higher yield which will pay for the difference in the cost of the Pyrox many times over.

Pyrox is obtainable in all sizes from 1 pound jars to 300 lb. barrels, and is offered at the lowest price since 1899. See your dealer today and obtain from him a copy of the new illustrated Pyrox Spray Guide.

203 Carloads of GATOR-HIDE shipped in less than four months

... and yet they said the American Farmer would never plant this new way.

OF COURSE, practically all well informed agriculturists knew three or four years ago how the pineapple growers of Hawaii were using paper mulch. But they said the American Farmer was too strongly wedded to traditional farming methods to revolutionize his ideas. And yet, we've shipped 203 carloads of Gator-Hide Mulch Paper in less than 4 months! And a car holds a lot of paper.

Large Scale Paper Mulching This Year
The answer is that the farmer has found out for himself just what Gator-Hide does. We didn't have to tell him that increased ground temperature, conserved soil moisture, and the elimination of weeds were beneficial to plant growth. He knew all that. All he wanted to know was whether or not Gator-Hide actually DID these things. And by experiments with just a few

rolls he found out. Now he's going ahead on a big scale.

The World's First Mulch Paper Planting Manual Free

The Gator-Hide Mulch Paper Planting Manual is just off the press. It contains helpful information on correct methods of laying, anchoring and planting. Send coupon for this booklet now—it's free.

If your dealer is not yet stocking Gator-Hide, write us direct, mentioning his name. \$3.50 to \$7.00 a roll—slightly more in Canada.

INTERNATIONAL PAPER CO.
Mulch Paper Division, Dept. X7
220 East 42nd St., New York, N. Y.

At left: Reversed Doctor Hamby of Hoboken, N. J., and his tomato plants, growing through Gator-Hide Mulch Paper. "Many of the tomatoes," reports Dr. Hamby, "weighed from 2 to 2 1/2 pounds." Above: Warming's Farm, near Buffalo, N. Y. Cabbage transplants in double rows through Type A, 24 inch Gator-Hide Mulch Paper.

GATOR-HIDE Mulch Paper
This paper is licensed for use in the 37 states east of Colorado and in Canada east of Saskatchewan under the patents of Charles F. Eckart, the inventor of mulch paper, which are owned by the International Paper Co.

Please send your booklet, "The Struggle of Mulch Paper and the Gator-Hide Mulch Paper Planting Manual," and tell me where I can secure a supply of Gator-Hide Mulch Paper in this territory.

(Continued from last week.)

CHAPTER XIII

Up to this time nothing has been said about the children in the home. On the first day of June, 1889, a son was born. We named him Dorrance Dana. On August 5, 1893, a daughter arrived who was named Gay. Dorrance from childhood was fond of books. Gay was well named. She did not dislike books, but she was more fond of play than her brother. He looked on the serious side of life, while Gay enjoyed a good time. Both these characteristics are commendable in children.

In a former chapter I had something to say about my limited opportunity for securing an education in the country schools. After thirty years, when my children entered school, we had as yet but a four months' term, a one-room school house, and very poor facilities for educating our children. On account of these things as well as because of the belief that many children are put into school at too early an age, our children were not started to school until after they were past seven years of age.

College Training

Dorrance completed the work in the grades at the age of thirteen, entered high school at Philippi, and a few years later began his college work at what is now Broadus College. Graduating from there, he then took a four-year course at Bucknell University in Pennsylvania, from which school he received his degree. At this writing he is Principal of one of the ward schools in Sioux City, Iowa. He married Erma Marsh, who had been a teacher in the Philippi schools for four years. They have two children, Susan and William D.

Gay followed her brother through the grades, graduated from Broadus College, and went to the Ohio State University, from which she received a degree in Home Economics in 1917. Subsequently she accepted a position in the Extension Department of the West Virginia University, where she remained about eighteen months. Her husband, Robert B. Dustman, is also a graduate of the Ohio State University. Recently he was awarded the Ph. D. degree from the University of Chicago after which he became Chief in Agricultural Chemistry at the University of West Virginia. Previous to this time he had served for a number of years as Extension Specialist in Crops and Soils at the Ohio State University. They have two children, Robert B., Jr., and Mary Jean.

I have discharged the duty that I believe every father owes to his children, that is, I have provided them with a fairly good education. This has given them something that no one can take from them. A great many people have the idea that the world owes them a living whether they make any effort to earn it or not. We tried to teach our children that the world owed them nothing, but that they owed the world the purest and most noble and active lives they could give to it. Because of their superior advantages over their parents, the world will demand, and have a right to expect of them, more useful lives than their parents have been able to lead.

Livestock Shipping

I was so eager to make money and get out of debt that I engaged in many things in which I thought I could earn a few dollars. These efforts did not always bring success. The shipping of livestock was one business that, had I left alone, I would have had more money to spend on other things. I was in the business from 1890 to 1900 and shipped thou-

sands of sheep and cattle. All these years I had a partner in the person of I. C. Woodford. In justice to Mr. Woodford I would say that our failure to make money at this business was no more due to him than to me. He did his part well and I tried to do mine well. But in the nineties no one went ahead very rapidly financially. It is hard to buy so as to make a profit on a declining market and that was the kind we had most of the time.

I recall a carload of cattle which we bought of Mr. T. They were good butcher cattle that averaged about 1,200 pounds. We bought them for two and one-half cents per pound or \$30 a head. Mr. T. had asked me three cents for the cattle and held to that price for a long time but finally agreed to sell them at two and one-half cents. We shipped the cattle, my partner going to the market with them. On his return we figured up what we had made and after paying all expenses we found that we had a profit of 86 cents on the load of cattle. They were sold in Philadelphia for three and one-fourth cents per pound. Mr. T. claimed after he had sold the cattle that we had mesmerized him into giving us the cattle. I do not know what would have happened had he been able to mesmerize us. He never felt kindly toward us from that date forward.

Deals in Lambs

On one occasion I went to Baltimore with three loads of cattle and a single deck of lambs (125 head). The cattle market was good that week and I sold the three loads, making us \$300. The lambs were consigned to a commission man who sold them for me. When I had paid the freight and the commission I had \$70 left for the 125 lambs.

On another occasion I had bought a lot of lambs of Mr. J. at five cents per pound. We had balanced the scales and driven in a draft of lambs when there came one of the hardest downpours of rain I had ever witnessed. After the rain was over we went back to the scales. The platform was covered with water and the lambs were soaked to the skin. I suggested that the lambs be driven off while the scales were rebalanced. Mr. J. objected strenuously, weighed both lambs and water and went to the house after notifying me that he would accept settlement on no other basis.

One winter I went to Toronto, Canada, in search of stock cattle. We found none on the market that suited us. Finally we drove out into the country 60 miles with a Canadian shipper, and spent Sunday in his home. On Monday morning the thermometer was 40 degrees below zero, but we drove all day in a sleigh and by night had bought two carloads of cattle.

Sometimes we bought only one animal in a place and, although the shipping point was eight miles from them, these Canadians drove their cattle in lots of one, two, three and four all of that distance and helped us load them. I doubt whether a place could be found in the United States where the farmers would be willing to do so much.

Most Shippers Fail

Shipping livestock is a fascinating business. Very few men ever quit after they commence until they break up and most of them do fail. In the fall of 1900 we had quit shipping for the season when a friend called me up from a neighboring county saying he had a load of good cattle he wanted to sell. After he had described

(Continued on page 28.)

Uses Pyrox Instead of Home-Made Bordeaux — Gets Increased Yield

IN every potato-growing section, the farmers who are using Pyrox instead of home-made bordeaux are getting bigger yields, finer quality potatoes, and more profits. The extra yields obtained with Pyrox more than pay for the cost of spraying and leave extra cash besides. Mr. A. J. Meyer of Annullville, Pa., writes:

Mr. A. J. Meyer of Annullville, Pa.

"Last spring I decided to make a comparison of Pyrox and home-made bordeaux sprays so I put on one-acre tests for each material.

"At digging time in September accurate measurements of the land and weights of the potatoes were made. The potatoes sprayed with Pyrox yielded 287 bushels per acre, and where the home-made bordeaux was used 241 bushels per acre. This was a gain of 46 bushels to the acre for Pyrox, a substantial increase. This gain pays the spray material bill and leaves a profit.

"All conditions for the two plots were the same in every respect and I believe that the Pyrox spray is responsible for the increased yield."—A. J. MEYER.

If you have not used Pyrox try it this year. Pyrox is a combined insecticide and fungicide that kills insects, prevents blight, and other plant diseases, and stimulates plant growth.

Quick and easy to use. It does not clog the nozzles and sprays in a fine mist. It has excellent sticking and covering properties.

Spraying with Pyrox not only results in the extra yields normally expected from spraying—the user can anticipate a still higher yield which will pay for the difference in the cost of the Pyrox many times over.

Pyrox is obtainable in all sizes from 1 pound jars to 300 lb. barrels, and is offered at the lowest price since 1899. See your dealer today and obtain from him a copy of the new illustrated Pyrox Spray Guide.

203 Carloads of GATOR-HIDE shipped in less than four months

... and yet they said the American Farmer would never plant this new way.

OF COURSE, practically all well informed agriculturists knew three or four years ago how the pineapple growers of Hawaii were using paper mulch.

But they said the American Farmer was too strongly wedded to traditional farming methods to revolutionize his ideas. And yet, we've shipped 203 carloads of Gator-Hide Mulch Paper in less than 4 months! And a car holds a lot of paper.

Large Scale Paper Mulching This Year
The answer is that the farmer has found

out for himself just what Gator-Hide does. We didn't have to tell him that increased ground temperature, conserved soil moisture, and the elimination of weeds were beneficial to plant growth. He knew all that. All he wanted to know was whether or not Gator-Hide actually DID these things. And by experiments with just a few

rolls he found out. Now he's going ahead on a big scale.

The World's First Mulch Paper Planting Manual Free

The Gator-Hide Mulch Paper Planting Manual is just off the press. It contains helpful information on correct methods of laying, anchoring and planting. Send coupon for this booklet now—it's free.

If your dealer is not yet stocking Gator-Hide, write us direct, mentioning his name. \$3.50 to \$7.00 a roll—slightly more in Canada.

INTERNATIONAL PAPER CO.
Mulch Paper Division, Dept. X 7
220 East 42nd St., New York, N. Y.

At left: Reverend Doctor Hanks of Michigan, N. Y., and his tomato plants, growing through Gator-Hide Mulch Paper. "Many of the tomatoes," reports Dr. Hanks, "weighed from 9 to 10 pounds." Above: Warning's Farm, near Buffalo, N. Y. Cultivators reported in double rows through Type A, 30 inch Gator-Hide Mulch Paper.

GATOR-HIDE Mulch Paper

This paper is licensed for use in the 37 states east of Colorado and in Canada east of Saskatchewan under the patent of Charles F. Eckart, the inventor of mulch paper, which are owned by the International Paper Co.

Please send your booklet, "The Miracle of Mulch Paper and the Gator-Hide Mulch Paper Planting Manual," and tell me where I can secure a supply of Gator-Hide Mulch Paper in this territory.

HAUCK WEED BURNERS

The modern, sure way to kill weeds. One burner burns 100 sq. yds. in 10 min. Burns weeds, grass, brush, etc. No smoke, no odor. Used by gardeners, farmers, country clubs, etc. Write for literature. Hauck Mfg. Co., 112 Tenth St., Brooklyn, N.Y.

Read the Advertisements

they keep you to the fore of modern life. Through advertisements you've laid down the shovel and the hoe. You can buy a whole harvest ready-to-eat in cans. You've hung up the fiddle and the bow, for a radio. There's little old-time work left in this age of amazing short-cuts. Read the advertisements carefully and when answering them, say you saw their ad in Pennsylvania Farmer.

Garden and Truck Crops

By GILBERT S. WATTS

ON April 21st we opened our roadside market with spinach, rhubarb, parsnips and onions on display. Although this is a rather limited assortment, sales have been worth while. In addition early opening with the things that are available presents a good opportunity to convince customers that only one's own products are being offered. These who do the selling inform customers what vegetables will come on next and the approximate dates.

THOSE who go on the retail markets early scarcely can afford to overlook fall-sown spinach. Only one variety, Virginia Blight Resistant Savoy, is worth planting in this way. Wheat seeding time, or possibly a week earlier, is about right. Mulch lightly to protect from winds and heaving.

THE fall-sown green manures are most interesting at this season when most of them are ready for the plow. Sown in the same field, side by side, rye in mixture with vetch is noticeably more green than rye alone. A mixture of timothy and vetch was sown between tomato rows at the last cultivation.

On account of the dry fall very little growth was made before winter. But now we have strips of good sod covering two-thirds of the soil surface. The same mixture sown in cucumbers at the last cultivation also will add a considerable amount of organic matter with very small expense. More and more I am convinced that consistent employment of suitable

green manurial crops makes it possible to grow a truck crop each year and at the same time build up fertility. Not that good clover sods are less valuable than has been claimed, only that some of us do not have space or time to grow them.

HOW the strawberry plants we set very early this spring are growing! Which reminds me that the two finest crops of strawberries that I ever have grown were from plants that were set when the air was so cold and raw that we will not soon forget the experience.

TOMATO planting time soon will be at hand. Ample spacing between plants and free ventilation, especially after some size is attained, will insure the sturdy, stocky plants that are best able to withstand the shock of transplanting, extremes of temperature, and the high winds.

Squashes

Will you kindly inform me where I can secure reliable information on growing and marketing Hubbard squashes? F. T. Schriener, Crawford county, Pa.

IN reply to your request for a source of information on squashes I would suggest that you request from the Extension Service, Massachusetts Agricultural College, Amherst, Mass., a copy of Extension Leaflet No. 101.

Ordinarily striped beetles on cucumbers and squashes may be kept in check by frequent dusting with one pound of calcium arsenate to 20 pounds fine ground gypsum or very fine pulverized limestone.

Value of a Garden

FARM sales have been numerous. Prices for horses have been better than for several years; cows lower, from \$70 to \$100, for good cows. Young stock sold well. Hogs seem scarce. A young sow and six pigs sold for \$70. Farm machinery sold very cheap.

A number of farmers are moving to the city or villages, some expecting to compete with an oversupply of labor, others to retire. All of those farms have supplied the country with the best of products, "good stalwart boys and girls."

The state and county and our cities are putting on an extensive road constructing program. In our immediate vicinity they are starting a \$150,000 joint county, state and borough road.

Our farmers have been busy plowing, hauling manure and repairing fences. Plowing is not the job it used to be. Old Dobbin looks over the fence and smiles at the odd contraption during his work.

Our truck and market garden men have their early garden in (April 15) — peas, lettuce and onions. The boys from our farm (grandsons) are still in school. They and I farm and mow about 30 acres of our 60 or more acres of plow land, while their dad commutes to work.

How Much Is It Worth?

When the census enumerator asked me how much my garden was worth, I replied that I had the largest and best strictly farm garden in the township. He said he had one valued at \$200. I said mine was worth \$225.

This garden, one-half acre in extent, furnishes fresh products almost every meal for six months, and canned goods every day for the rest of the year, to a family of ten persons, and to a daughter and her husband in Buffalo. And we have lots of friends come to visit us when cauliflower, we produce 500 to 400 heads of Lima beans are ripe, and all sorts of garden produce. The garden is in Varango county, Pa.

In this plot we do not include cabbage, sweet corn or berries, which we class as field crops.

Say, readers, did you ever feed six growing kids and two hungry workmen—not counting myself and daughter? After careful study I believe I would have been safe at \$300.

I fertilize every year. When we were running a garden and berry farm this plot was used mostly for growing plants and early onions and beets for bunching. We usually stuck one and a half bushels of sets. It is ten rods long.

No Trash Here

I plant it in rows. My seed bed and such stuff as onions, lettuce, spinach, beets for early use, I space 12 inches apart and use a scraper (either a hoe two inches wide) never disturbing the roots. Lima beans, peas, tomatoes, summer squash, 40 inches; beans, carrots, beets and for winter storage canning, etc., 20 inches. I use a faithful old mule to cultivate a few times, but rely on a sharp hoe mostly. "Cukes" take seven feet through the center.

Excepting to plow, harrow and cultivate, I have done all the work in this garden. The boys say I am too particular. Perhaps I am, but I hate to see a job of butchering done, especially in the garden. I have practiced with the hoe for 70 years, but want to die in the harness.

The experts tell us to burn all weeds and trash in the fall. We don't have any such "animals" in our garden. As soon as peas, beans and tomatoes are done bearing they are trapped in the manure and I would consider my standing as a gardener impugned if a person found a weed gone to seed. After crops are harvested I open the gate and let the chickens have possession. They do a thorough job of digging and turning the ground and weeds. O. C. Sigurdson, Varango county, Pa.

The MARKET PLACE

By W. R. WHITACRE

THE strawberry season has started and the eastern markets are receiving fairly liberal supplies from Louisiana and North Carolina. Thanks to the refrigerator car and other improved methods of transportation "strawberry short-cake" time lasts over six months.

The first berries come in "reefers" or refrigerator crates from Florida and are often available, to those who have the price, for the Christmas dinner and even earlier. These crates are actually ice boxes, with compartments for ice and berries. They are shipped by express, but along in January and February there are enough berries available to load straight cars. Louisiana is the next state to supply the "makings" for our cake, and by this time the price is generally down where the average consumer can buy an occasional quart.

Period of Liberal Supplies
North and South Carolina are next but in recent years they have switched from rail shipments to the use of the motor truck and are now shipping more berries in this way to the eastern markets than by rail. Close on the heels of the Carolinas comes the Eastern Shore section of Virginia, Maryland and Delaware and then is the period of most liberal supplies. New Jersey often overlaps the Eastern Shore season while Pennsylvania and New York wind up the season.

May and June are generally the months of heaviest supply and in recent years the increased plantings have often resulted in periods of oversupply which were very costly to the growers. The perishable nature of berries makes it necessary to sell them soon after they arrive and they cannot be held for higher prices. These periods of poor prices often rob the growers of the profits that they have made in the earlier part of the season and this has had a tendency to reduce acreages. According to a recent government report, there will be fewer berries this year. The production forecast is 140,711,000 quarts for the early and second early states, compared with 158,704,000 quarts in the same states last year.

Smaller Acreage

The strawberry acreage in all producing areas this year is estimated at eight per cent less than last season and 11 per cent below the 1928 figures. The Florida season is over and the Louisiana crop estimate has been reduced to approximately 2,500 carloads. Louisiana is the largest strawberry producing state and the crop this year is placed at 29,815,000 quarts as against 34,104,000 quarts a year ago.

Philadelphia is a good outlet for strawberries for two reasons. First the people like them and eat them freely and secondly because it is the center of the ice cream industry of the United States. The ice cream industry uses large quantities of berries and they are good buyers. Weather rather than price controls the amount they purchase. Hot weather increases the public's demand for ice cream and sales of berries to the ice cream men improve. The buyers demand well ripened stock of good color and green tips are not wanted.

"Milk!" asked Mr. Casey, "can your wife cook as well as your mother did?"

"She can not," replied Mallicki, "but, my friend, I never mention it, for she can throw considerable better."—Argonaut.

"Beg pardon, sir," said the doorman at the high class club entrance. "Haven't you made a mistake?"

"I reckon not," replied the young gent. "The sign on the door says 'No admission,' and if they're no admission, it's free, ain't it?"

When the Sun Is High — Make Hay the McCormick-Deering Way

New Cylinder-Rake
Hay Loader

WHEN the sun blazes at haying time, owners of McCormick-Deering Haying Machines experience great satisfaction in knowing they have tools that can handle a bumper crop quickly or make the most of a short crop.

The complete McCormick-Deering line includes horse-drawn and power-driven mowers, combination side rakes and tedders, self-dump rakes, the cylinder-rake and the windrow hay loaders, sweep rakes, and stackers.

The Cylinder Rake Loader is a newly-designed combination of the cylinder and rake type loaders and it picks up hay from either the swath or windrow. It is a one-man loader, built entirely of steel with the exception of the rake bars. McCormick-Deering Mowers have long been famous for their high-lift feature and many others that reduce wear. The Side Rakes and Tedders form quick-curing windrows and have ball and roller bearings at important points to provide light draft.

Don't wait until haying time to find out how you stand on hay tools. Be ready for this busy season by checking over your equipment now and seeing your McCormick-Deering dealer.

THE YOUNG PEOPLE

They Made the Best Better

THE Lititz Four-H Garden Club of Lancaster county, one of the most successful Four-H clubs ever conducted in Pennsylvania, has decided to continue after four years of very outstanding work. The girls intend to do homemaking club work, while the boys are going to try their hands at growing tobacco and feeding baby beebes. They got out about \$1,500 over the four-year period.

The club was first organized in the spring of 1926 with ten members, two of whom dropped out. The first year they took over the home garden and proceeded to grow the vegetables needed for the family table. They were required to grow at least twenty-five varieties. They were successful and with an eye for business disposed of the surplus by supplying the needs of various families residing in Lititz. Some of the products were sold in the public market in Lancaster. They had an average return of about \$20 over and above their expenses at the end of the year.

The following year they expanded and planted more vegetables. In order to facilitate the disposal of their products they rented a booth in the public market house where they offered their surplus products for sale. They sold \$178 worth of foodstuffs picked fresh from the garden. The club finished with eleven members.

In 1928 the club again expanded. Some of the members grew flowers, others joined a canning club, which had been organized in the neighborhood. The average size of their gardens was about one acre. Their profits ranged from \$40 to \$100. For the second time in succession their exhibit of vegetables was awarded first prize in the Lititz Farm Products Show, in competition with adult organizations.

This past year special crops were grown, such as celery, sweet corn,

Drawn by Hope Lehigh

a stunt which provoked much merriment. The Lititz club put this on so well that it was requested they perform it for the benefit of those attending the annual meeting of the Lancaster Agriculture Extension Association, which they did.

Mary Brubaker, who was one of the outstanding members of the club, serving as president for the first three years, was a delegate to the National Four-H camp for club members, which has been held annually at Washington for the last three years. She qualified for this honor by her work in a homemaking club, in addition to her efforts as a gardener. Another member is at present a student at Pennsylvania State College.

James F. Keim.

A Bird Bath

SET in a wooden box the granite dish which serves as the bath. Lining the dish with paraffin prevents its rusting the first season. On each corner of the box nail a three-cornered piece of wood where the birds may perch. Nail the box on one end of a two-by-four-inch piece of lumber. On the other end of this board nail another piece of wood to serve as the foundation of the structure and set up the bath in the garden, heaping stones on the bottom board to keep it balanced.

Be sure to make the bath sufficiently high so that a cat cannot jump into it, and see to it that the rim of the dish is narrow enough for little claws to curl over.

Indian Doll

MAKE an Indian face of paper, color it red, and paste to the head of a clothespin. Use black darning cotton for the doll's hair. Braid it into two braids for a girl. Then fasten it to the top of the clothespin

MOTHER'S KISSES

They're good for bumps, and good for lumps.
They're even good for dumps and grumps.
They're good for stings of "lumpy bees".
And barks from "shinnying" cherry-trees.
For splinters, sun-burn, "shocker-ries".
For "bumped feelings" after fights.
And scratches, scratched skin, and bites.
Mother's kisses.
There's naught so pure, there's naught so sure,
For pained fingers, stubbed toes,
And all the long, long list of woes.
Yet do you ever think it queer
That while they're fine for every fear
They're just as fine with all the blues?
Mother's kisses.
—Annie Balcomb Wheeler.

with paste, letting the hair and braids fall around the face. Use brown crepe paper for making clothes, cutting slashes for fringe around the skirt and coat. Trim with bright yarn and beads.

That Disappointed Boy

I FEEL sorry for that "Disappointed Boy" and the others who want to leave their fathers' farms. I have splendid parents and I never get any stock of my own. My two cats are all I have.

I just want to say to those boys—remember you are putting your feet under your Dad's table, staying under

his roof and also using his pocket-book for clothing. Now think of being an orphan without parents—no one to love you like your mother who always takes your part.
I am going to stay right here on the farm as long as possible. I am a girl fifteen years of age.
A Contented Girl.

NEXT WEEK

CARTOONS and stories in our recent contest about school will appear next week. Announcement will be made of new and interesting contests. Watch for the Young People's page next week and join in the fun.

Little Folks' Corner

When We Grow Up

LAST week we asked the Little Folks to tell us what they were going to do when they got big. Here are just a few of the many interesting letters which have come in. It seems about five hundred girls are going to be school teachers; quite a number want to be nurses; two think being a missionary quite the finest thing on earth while the boys, for the most part, prefer to stay "with Dad."

Lewy McB. has this to say:
"I am nine years old. When I grow up I want to be a clerk in a big candy store where there are many different kinds of candy, peanuts and other good things to eat."

Belle A. is going to be a big help to some editor.
"When I grow up I'm going to find puzzles for the little folks to find out what they are. I think it so much fun now."
Why not send us some, Belle?

But Ada E. is tired of being bossed. Listen to this:
"When I grow up I want to be an old maid and live in a little house by myself and have everything just the way I want them and I'll be my own boss. It will be wonderful not to hear my sisters saying, 'Ada do this' and 'Ada do that' all the time."

A CLOWN

Did you ever see a circus with animals and things?
I saw a circus once with three big rings.
The clowns made me laugh so much.
I forgot my sister Anne.
Who was looking at the pictures on the tattooed man.
When I am big, I'm going to be a regular circus clown.
And I'll make fun for everyone in our home town.

time, I'll do sewing and washing for other people and I'll soon be a rich old maid."
Don't you think you better have a cat, Ada? Just in case you get lonely!

Elizabeth W. is one of the five hundred who want to be school teachers.
"I'm going to be a school-teacher. Not the cranky, strict kind but a pleasant so-cial teacher. When I am old and cranky I'll retire on a pension. Then I will sit back and take life easy."

Letha C. is only eight years old but she is quite sure what she is going to do.
"I am only eight years old but when I get big I'm going to powder and paint like the big girls. I am going to ride around in a big car with my beau. I am going to work in a big factory and dress in my best things there. I am not going to stay home and milk the cows and feed the chickens. What's the use of doing such things for you can't make money that way."

Betty W. says:
"I am now ten years old and in the fifth grade. I like our Young People's page very much and always hunt it out the very first thing when we get the paper. My greatest ambition is to become an editor. I like to write stories. We had a program at our school and I wrote an original Easter story which my school teacher is having published in one of our town newspapers. I am going to try to get an education so I can be a story writer some day."

The Little Folks want to read your story too, Betty, so send a copy of the paper.
"First of all," says Donald W., "I want to grow up and be a good honest man. I am doing all my health rules so I will be a strong man, able to carry on my work

Prizes for the best coloring of the sailor boy. Hurry him back to Little Folks' Corner, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

PASSING EVENTS IN PICTURES

(Copyright by Underwood & Underwood)

1. The No. 1 Mary Sudik Oil Well at Oklahoma City, Oklahoma, spouted for nearly ten days at the rate of 2,000 barrels an hour, with an estimated flow of gas of 200,000,000 cubic feet per day, before workmen could finally fit a special die nipple into place, which brought it under control.
2. The most expensive car in the world—a specially built white Pierce-Arrow for His Imperial Highness, the Shah of Persia. The metal work, including radiator, lamps, bumpers, running boards and giant hub caps are heavily plated with gold. Replicas of the royal crown, studded with gems, are mounted on doors and fenders.
The interior is tailored in champagne-colored

silk rep, embroidered with the royal insignia of Riza Khan's family. A robe of Russian wolfhound fur is used as a floor mat. A diamond studded cigarette case and smoking set are included. The trim is of intaid satinwood. Chassis is standard Pierce Arrow 144-inch wheel base and the straight eight motor develops 132 h. p. The gems used for decoration are worth \$500,000. It is estimated.
3. Chicago, Illinois.—Lee Sentman, 75 yard high hurdles champion, is a sophomore at the University of Illinois and will be a likely candidate for the 1932 Olympic games. Photo shows how a champion takes the hurdles.
4. Los Angeles, Cal.—Photo shows Assistant Chief E. P. Boyle of Honolulu jumping during

class work at the experimental tower of the L. A. Fire College where department heads from all parts of the country are taught the latest developments of their profession. Assistant Chief S. H. Dodd of the Los Angeles department heads the college.
5. Six souls with but a single thought. Photo shows a fine action picture of members of Harvard's Varsity lacrosse team reaching up for a high ball during practice for their lacrosse game with the British aggregation from Oxford and Cambridge Universities.
6. Berlin.—Photo shows the very latest in street cleaning machines, resembling somewhat a tank of a new design. It is a combined vacuum sweeper, sprinkler and mopper.

To know what to buy—read the advertisements. They will keep you informed of the latest and best products of the manufacturers. Their aim is to meet your needs. You will find that time spent in reading the advertisements is time well spent. Read them regularly, with care and when answering, mention Pennsylvania Farmer.

Feeds and Feeding

A good hog well fed is most of the story of making money with swine. No other feed matches corn as a pork maker. In olden days we said a bushel of corn should make ten pounds of pork. Occasionally it did and even more when the hogs had plenty of skim milk.

The Inquirer lives in Maryland where corn grows to perfection and

The Stock Company Stallion

THE salesman of stock in a company stallion is the man who can, for a few days' work and a few hundred dollars of the farmers' hard-earned money, make a great sacrifice in the interests of horse breeding. And such a sacrifice! Ten days time in some communities, perhaps a share of the thousand or twenty-two hundred dollars profit, to a selected few of the leading farmers of the community.

Let us look at the proposition squarely. In the first place we can agree to the statement that horses are essential to agricultural prosperity. Not only are they necessary in tilling the soil, but they furnish a market for certain farm products.

It is a recognized fact that the quality of the horses used has improved. Many undesirables are being weeded out. The light draft horse is not in great demand. The owner or driver cannot get a great deal of satisfaction out of such motive power. He is, therefore, looking for a good-sized, well-developed, efficient power unit to do the farm work and utilize crops raised on the farm.

Raising Colts

Many mare owners are considering the matter of raising colts. This can be done and the owner get a good season's work from the mare. This belief in value of colt raising involves certain problems, one of which has to do with securing the services of a suitable sire. In some communities this problem is solved by the purchase of a stallion by some individual who is interested in furthering the horse industry, and who is capable of handling a stallion. In other communities an attempt is made to solve the problem by placing a company stallion in a community as a means of lessening the original cost per individual. But does this plan lower the cost?

The answer to this question can be obtained by looking over the records of companies purchasing such stallions. For example, ten men have purchased a stallion at \$300 per share or a total of \$3,000 for the stallion. How many stallions are worth \$3,000? Does the company stallion salesman handle this type of horse?

To the questions one can reply that International grand champions have been purchased for this figure, but such horses do not get in the hands of a dealer. The company stallion salesman handles stallions costing from \$250 to \$800. It is possible that he may have a few over this sum but the major portion can be purchased for \$300 to \$600.

Converts to the Cause

In the same county where the above case was recorded a 2,100-pound, seven-year-old stallion could have been purchased for \$700 or \$70 per man of the same company. His offspring could have been seen and the breeding of stallion definitely determined. A younger stallion might have been purchased for \$400 by the same group.

We have great faith in human intelligence in most matters. But in the matter of purchasing stallions there seems to be a deviation from normal procedure. Nor do we feel that horse breeding can be stimulated by this method. With the number of high-class horse-breeding establishments in Pennsylvania; with the demand for many carloads of replacements annually; with information regarding horses available, it would seem logical that attention should be paid to good, sound purchases of breeding stock.

We feel reasonably certain that before the notes on this year's company stallion purchases have been met, we will have at least twenty converts sitting down in the amen corner and with hands on their wallets, declare in all seriousness, "It can't happen again." J. F. S.

The Farmers' Interest In This Campaign

There are several aspects of this Primary Campaign which are of serious concern to the people of the rural districts of Pennsylvania and especially to the farmers of the State.

As a candidate to succeed himself, we believe that United States Senator Joseph R. Grundy commands the confidence and respect of all our citizens. His ability has been proven, and his integrity is unquestioned. His appointment to the Senate last December, by Governor John S. Fisher, was acclaimed with approval by the press and people alike, and there has been nothing in his conduct since, or in his handling of the public problems that have come to him as the lone Senator from Pennsylvania during the prolonged absence of Senator Reed at the Naval Arms Conference in London, to warrant any change in that public opinion and attitude.

Indeed, it is a highly significant fact that the chief argument which his opponents for the place bring against him, is that they themselves want the office. And that is wholly negative reasoning.

It should be of interest to the agriculturalists of Pennsylvania that although Senator Grundy has been an outstanding industrialist, he is himself a farmer and has lived upon a farm nearly all his life. Naturally, he has a first-hand knowledge of, and a keen sympathy with, all of the farmers' problems. As a Senator, he voted for every protective duty that was proposed for farmers in the pending tariff bill.

For years Senator Grundy has been the acknowledged political leader of Bucks County. Acting under his guidance and advice, the members of the Legislature from that County have been among the best friends that rural and agricultural Pennsylvania have had in the State law-making body. Particularly has Senator Grundy's support of all constructive legislation for the rural and agricultural districts been furthered by State Senator Clarence Buckman, of Bucks County, who is chairman of the Good Roads Committee, and by Dr. W. A. Haines, Representative from Bucks County, chairman of the Agricultural Committee of the House.

But never was Senator Grundy's character shown to better advantage, nor his loyalty to his State and his friendship for the town and country sections more conclusively proven, than when he flatly and unqualifiedly declared that he would far rather retire from public life than ally his candidacy with those whose avowed purpose is to raid the State Treasury for the support of large projects in the City of Philadelphia.

He refused to have any dealings whatever with the Philadelphia Organization. It was then that the discredited Philadelphia Machine picked James J. Davis as its candidate for Senator.

We believe that in the light of these facts we are justified in asking you to

Farm Facts and Fancies

By ALVA AGEE

CAPTAIN DAVID SHIELDS, of Allegheny county, Pennsylvania, regards the ordinary commercial fertilizer as only a stimulant, and he writes an interesting letter giving his views of coal, clay and salt water as a fertilizer. He backs up his statement of the work of the latter mixture by sending a liberal sample of treated soil, that cost him quite a few dollars for express charges, and a sample of the mixture used. Then by mail he sent a portfolio containing some excellent photographs of crops. He says that coal is humus, the clay is the material in which the vegetation grew that made the coal, and that these two, together with subterranean salt water, provide all that the soil needs.

One soil and subsoil sample, taken from a field seeded to grass seven years ago, shows that the original plastic clay has been mellowed and is producing a heavy grass sod, while another sample taken nearby from land fertilized by chemicals is compact and evidently not productive. The photographs support all that the Captain claims for the mixture.

Surrendering One's Views

Now, I do not believe that Captain Shields expected that I could readily accept the thought that the orthodox belief is all wrong, and that certain proportions of nitrogen, phosphoric acid and potash need not be added to a poor soil to make it productive. Of course these soil samples are disconcerting, and so are the photographs, but it is mighty hard for a man to swap beliefs. That is what makes it difficult for those who blaze new trails.

The Captain does not even ask me to believe, but he courteously suggests that I try some pot experiments like those he photographs, and thus to learn for myself. That is about the only way to get any new startling truth across to a white-headed man. And so I got the pots and some seed grain and shall see what results. My scientific friends now know exactly what will happen, and curiously enough, on the opposite hand, Captain Shields knows what will happen, while I shall maintain the impartiality and open-mindedness that so become a man engaged in research.

A Potato Exhibit

Many years ago I attended a farmers' institute where a most attractive exhibit of potatoes was made by a man who grew them on top of a mountain. My memory may not let me tell the story with exactness, but this man had abandoned his profession and gone up on this mountain where the evidence of soil fertility was not apparent. He ripped the surface open to an extraordinary depth and planted potatoes. He did not believe in commercial fertilizers, and he

assured me that manure clogged up the soil so that the water in the earth, laden with dissolved plant food, could not rise freely to feed plants.

Year after year, as it appeared, he was getting crops of fine potatoes, and the yields ended any argument that one might be inclined to start. It would be my guess that yields fell off a little later, but that is only guessing, and some reader may know of the instance and can tell us how long nature acted so curiously in the case of a soil that had been regarded as infertile. And yet, Dr. Milton Whitney, of our federal Bureau of Soils, has long held that we felt an unnecessary dependence on the application of chemicals to the soil, and that nature is equipped to keep our moving soil water pretty well supplied with the elements of plant food.

Ants and Plant Lice

The ant easily qualifies as one of the most pestiferous insects of warm climates. Among its bad habits is that of caring for plant lice. We have two young orange trees that are specially attractive to the aphids. We give them generous sprayings of nicotine sulphate, but within a week after a spraying one may see the ants going up the trees and another infestation of lice is being started. Yesterday I saw a tiny crinkled leaf on a new twig and found on the branch a single aphid and an ant in attendance. It looked like small business for an able-bodied ant, but the aphid doubtless was in the way of building up a colony which it can do in a remarkably short time.

The number of ants around the house and in the flower garden is kept under control with a sweetish poison put into tiny glass jars that are placed in their runs. It is claimed that the ants carry the material to their nests and thus the young are killed. Be that as it may, the number of ants is kept down to a small fraction of the great army that abounds when no poisoning is done.

Three annoyances of sub-tropical countries that are ignored in advertising literature are the ant, the aphid and the snail. The last has a voracious appetite and is kept under control by poisons. It is a most defenseless creature, and poisoning is a low form of warfare, but the snail has no known rights.

For Better Beets

BEETS need good rich soil, well supplied with moisture. The ones that have good growing conditions and come quickly are most tender and flavorful. Any checking of the growth may result in stringiness and a strong taste. Where manure is not used, a 5-10-5 fertilizer at the rate of a pound to thirty square feet is desirable. A light application of commercial fertilizer should be made also.

—N. Y. College of Agriculture.

For the Good of Pennsylvania vote the Davis-Brown Ticket

JAMES J. DAVIS for U. S. Senator

Secretary of Labor under three presidents.

The Great Conciliator in disputes between Labor and Capital.

Friend of Farmers—champion of Community Business Men.

Protected American labor by his strong support of adequate tariff schedules.

Chairman of Federal Board for Vocational Education—making possible persons incapacitated by injury to return to profitable employment.

Has helped in the development of our waterways and is an ardent advocate of good roads everywhere.

Founder of a great school for orphaned children at Mooseheart, Ill.

Established a Home for the Aged at Orange Park, Florida.

A Friend of the masses—Humanitarian Builder.

FRANCIS SHUNK BROWN for Governor

Stands squarely for Referendum on the Wet and Dry Question, so the People of Pennsylvania may individually voice their views.

While Attorney-General drafted and vigorously fought for acts which placed on statute books Employers' Liability and Workmen's Compensation laws—as well as laws regulating Woman Labor and Child Labor.

Opposed to increased taxation, and believes that present burden on people should be reduced wherever possible.

Lifelong advocate of good roads, and stands for increased State aid in the construction of Township highways.

Favors measures for the further protection of the Health and Safety of the employed.

Vice-President of the Board of City Trusts, which controls all moneys and property given the City for philanthropic purposes—helps to administer Girard College for orphan boys.

Holds that Hospitals receiving State aid should treat, without charge, service men, miners and other citizens to whom payment would be a hardship.

Favors an increase in the pay of public school teachers.

APPLES AND POTATOES

EASTERN farmers have not been so much interested in the Federal Farm Board's plans for cotton, grain, livestock and wool marketing as they will be in its plans for marketing potatoes and apples. Representatives of the potato growers met at Washington last week and selected a committee to work out plans. Representatives of the apple growers will meet this week for the same purpose.

ENTRIES CLOSE MAY 31

MANY counties are still unrepresented on the list of progressive farmers whose names have been submitted as candidates for the Master Farmer Awards of 1930. Let us suggest again that you do not leave it to someone else to nominate your choice for the Award. A letter giving his name and address will insure the careful consideration of his standing and achievements by the judges. May 31st has been set as the final date for receiving nominations.

TOO FAR

IN almost every movement somebody goes too far. So it is in the campaign to prevent overproduction in dairying. Some zealous persons have advocated not merely the disposal of unprofitable cows but the sacrifice of good cows and the short feeding of all cows. That is going a long way too far. If dairymen will get rid of their unprofitable cows they won't suffer by surpluses. Efficient herds and proper feeding for economical production are essential to profit any time, and profit isn't going to hurt anybody.

FROM LIFE

A MAN who has become a farm owner after many years as tenant gives us his experience. During his career as tenant he operated several farms. As his term expired in each case he held a public sale of surplus livestock and other things. Every time he was surprised at what he had accumulated during the three or five years of his work on the rented farm. Finally he got enough to buy a good farm and now is a solid citizen of his community. He takes commendable pride in the fact that he left every farm better than he found it. That kind of a tenant is pretty sure to own a farm some day.

LEGUMES AND MALARIA

SCIENTISTS and practical farmers have long vied with each other in extolling the virtues of legumes, since they feed animals and improve the soil. More credit for this

PENNSYLVANIA FARMER

popular plant family now comes from a Russian physician whose observations lead him to believe that the nodule bearers are harbingers of health as well as sources of protein. Noting the prevalence of malaria in most parts of the world and its absence where alfalfa, clover or other legumes are grown he concludes that the malaria-spreading mosquito is rendered harmless by eating a substance found in legumes. If it is possible to divert the attention of mosquitoes from tender hides to succulent legumes the legume tribe will find its host of admirers expanded still more.

AN INSTANCE

IMPORTING countries have reduced their consumption of our wheat by increasing their own production, by measures encouraging the substitution of rye, by increasing extraction of flour and other economies in use, by higher tariffs and possibly by a disposition to buy in a free market. A notable instance is Italy's campaign for home production and its effect on imports. During the first nine months of the current crop year Italy imported only 19,549,945 bushels of wheat. In the same months of the preceding year Italy imported 62,008,970 bushels. The difference is a market influence of no small moment to exporting countries.

CLEAN FAIRS

THE Grange is campaigning for clean fairs in the belief that some of the so-called attractions put on at county fairs are injurious to the morals of the community and distasteful to upright citizens. In one instance the Order is reported ready to boycott a fair in Pennsylvania because its management refuses to "clean up." The Grange's stand in this matter will meet the approval of all persons interested in better fairs, for the farther we get from agriculture in our county fairs the nearer we get to the end of their usefulness and their ultimate disappearance.

OUT OF THE DUST

IT is unfortunate that the recent action of the Chamber of Commerce of the United States should be regarded as a movement of business interests against agriculture, but it is so interpreted. That is a petty view of the case albeit a natural one under the circumstances. The questions which should be asked and determined are worthy of discussion not clouded by class prejudice. They involve the right of Congress to devote public funds to such uses as the stabilization policy requires, the economic soundness of the participation or intervention of government agencies in marketing or other business not properly public enterprises, the commercial feasibility of such action by government agencies even if constitutional, and the ultimate effects of such a policy on agriculture, business and international trade. Let us try to view these problems in the clear light of reason, regardless of the dust kicked up by partisans official, commercial or political.

FOURTH NATIONAL BODY

LAST week representatives of cooperative marketing organizations formed the National Livestock Marketing Association, a corporation to operate under the plan prescribed by the Federal Farm Board. The Association is to have two subsidiary bodies, the National Feeder and Finance Corporation and the National Livestock Publishing Association, the duties of which are indicated by their names. The new national livestock marketing agency starts without the support of two important groups now engaged in cooperative marketing, groups which claim to handle about 50 per cent of the livestock now marketed in this way. Whatever may be said of the Federal Farm Board it cannot be

charged with inactivity, for in a few months it has created national organizations to handle grain, cotton, wool and livestock.

A CHANCE TO LEARN

A READER who fails to sign his letter is quite certain that somebody is getting too much when prices of live-stock and meats are so far apart. He evidently considers the retailer the guilty party. Maybe some retailers are getting too much, but if he wants to join them and get a slice of the profits he can find him plenty of opportunities to do so. Among our comparatively recent educational experiences is the ownership of a retail market, thrust upon us by circumstance. After a couple of years in the only school which fools will learn we haven't picked up much knowledge of profits but have a fine line of information about losses.

TRIUMPH FOR COOPERATION

WHEN the Joint Committee representing equally agriculture and the electric light and power industry was created by mutual action of the leaders of both interests, the cause of rural electrification, Pennsylvania was in a bad way. The farmers raised by the farmers to promote that cause had all been spent without any important results. The companies were not in a very happy mood after facing threats of legislation which they regarded as destructive. Hundreds of complaints were before the Public Service Commission and not much progress could be made in settling them because the determination of any individual case means little more than that, could mean little more than some definite policy and plan of action generally applicable and fair to both interests. The Joint Committee faced a job, one that could not be done by coercion, legislation or in any other way than by cooperation. Realizing this basic fact both interests resolved to endeavor to do it by operation. That policy has been followed with the result that Pennsylvania's progress in rural electrification has attracted national attention; and what is now known as the Pennsylvania plan is being studied and copied in other states.

All this has been no easy task. The members of the Joint Committee should have more credit than they are likely to get for it. For they found obstacles not generally known or understood by those who cannot read the difficulties of so great a work. For the financial extensions is a problem generally realized—they have cost \$16,000,000 so far. The banks which furnish funds for such purposes naturally and properly demand some evidence of return on the investment. That involved initial and later schedules. Costs of extensions were great, involving high initial rates. These have been reduced, after much study and experience, and farmers are allowed to reduce them wherever they are in position to do so. Work cheaper than the companies can do. Rates are coming down as the use of electricity grows, and the big problem now is to expand use as to permit the application of low rates—which are the same in rural as urban territory. A whole battalion of problems confronting the Joint Committee during its years of work have been fairly met, among them hundreds of individual cases which could have been handled in no other way. It is too much to say that a complete solution of all problems has been found, for the problem keeps on coming. But if the spirit of cooperation continues, as it should, and if the committee functions in the future as in the past, the problems will be faced as they appear with every promise of sensible and equitable solution. Pennsylvania's plan is a triumph for the principle of business cooperation between great industries and an example of the principle's advantages over warfare.

New Jersey Farm Comment

By G. W. HARRIS

of bees to growers of apples, pears, cherries, peaches, blueberries and cranberries.

There was a time when beekeepers paid fruit growers for the privilege of placing colonies of bees in orchards for the production of honey. Now the tables have turned, growers pay beekeepers to place bees in their orchards for pollination purposes.

Mr. Barclay provides a unique type of service to fruit growers. He must work with the "weather man," must have strong, healthy and active colonies of bees in over 3,000 acres of orchards at the time of bloom of different varieties of apples, cherries, pears and certain varieties of peaches, and must again remove these bees from the orchards before poisonous sprays cause serious losses to his colonies. For this service Mr. Barclay charges the grower ten dollars for each colony.

After listening for a while to an enthusiastic producer of honey this rental system for pollination purposes would seem to be a small gold mine. But such is not the case. Mr. Barclay explained that the moving of the colonies reduced the honey production about 50 per cent and that during many seasons bees used in pollination work do not manufacture enough honey to provide food for the colony during the winter. The primary purpose of Mr. Barclay's bee business is to provide pollinizers for fruit growers, not the production of honey. Most of the 641 colonies are Italian bees, but

Last season the cold blooming season in many sections resulted in poor pollination in many instances because of inactive bees.

MANY home-owners in the Japanese beetle infested territory during past years have realized too late the damage being done to their lawns by the beetle grub. While most of these owners are now treating their lawns with arsenate of lead for protection, the beetle last year advanced toward new and unsuspecting victims.

The grubs in infested lawns are now approaching the surface and feeding heavily on the grass roots. In order to destroy these grubs the Department of Agriculture recommends application of arsenate of lead in proportion of five pounds to each 1,000 square feet of turf to be covered. The arsenate of lead may be mixed with sand or fertilizer and sifted uniformly over the area to be treated. The lead is very penetrating and quickly enters the soil, generally following the grass roots.

* * *

DURING the past week of extremely dry weather forest fires have been raging in eastern states. Already over 60,000 acres of New Jersey forest has burned and on the Eastern Shore over 50,000 acres of timberland has been consumed by fire. One fire last week covering between 25,000 and 30,000 acres threatened to destroy Georgetown, the county seat of Sussex, Delaware.

* * *

THE simple expedient of observing new spacing rules in planting tomatoes, cucumbers and cantaloupes will enable vegetable growers to obtain larger yields with less labor, says C. H. Nissley, New Jersey extension horticulturist in vegetable growing.

For years, he points out, tomatoes have been spaced at distances of four feet each way to allow the growing of 2,722 plants to the acre. Such spacing has been favored because it facilitated cultivating both ways.

"The better distance for planting tomatoes," Nissley advises, "is three by five feet. This spacing allows the setting of 2,905 plants to the acre, 182 more than the older planting rule. Furthermore, the extra foot between the rows gives more room for spraying, and for harvesting the crop.

"In south Jersey cucumbers and cantaloupes are usually planted in hills four by five feet or five by five feet apart. These plantings require hand labor to apply fertilizer, especially if it is placed in the hills. The more economical method of planting is in rows six feet apart with the plants thinned from 12 to 15 inches apart in the row. The advantage in row planting is that the fertilizer can be applied with a horse drill. Side dressings also may be made with labor-saving equipment, and hand labor can be reduced to a minimum.

DR. LEON A. HAUSMAN, head of the zoology department, New Jersey College of Women, has been appointed consulting ornithologist for the New Jersey Agricultural Experiment Station, according to the announcement of Dr. J. G. Lipman, Experiment Station director.

As consulting ornithologist for the Experiment Station, Dr. Hausman will prepare a number of publications on bird life in New Jersey. He is the author of two Experiment Station bulletins, "The Hawks of New Jersey," and "Woodpeckers, Nuthatches, and Creepers of New Jersey," thousands of copies of which have been distributed to residents of the state.

POUULTYMEN in Sussex county, Delaware, complain that several gangs of thicken thieves have been operating in the county. Poultry production is fast becoming the principal industry of Sussex and the losses are being taken to heart.

Your Opportunity to See America

Pennsylvania Farmer's Tour Through
18 States and Two Provinces of
Canada.

WHAT—A Pacific Coast—Yellowstone Park tour sponsored by Pennsylvania Farmer in cooperation with several railroads. West through the northern states and southern Canada, returning by the central states.

WHY—Because, by managing the tour as a reader service, Pennsylvania Farmer can offer a more attractive trip at very much lower cost than any individual could obtain for himself. Also because of requests for another tour from enthusiastic members of the Florida-Cuba Tour managed by Pennsylvania Farmer last winter.

WHO—You and your family and friends, we and ours—anyone who wants to know more about the Great Plains, the awe-inspiring Rocky Mountains, the proud Pacific coast cities, the magnificent distances of this great land of ours. The tour party will be in personal charge of one of the editors of Pennsylvania Farmer and several railroad officials.

HOW—By chartered Pullman cars and special train with our own dining and observation cars, and with automobiles for numerous side trips. It is to be an all-expense tour. You make one payment before you start. Then you can leave your pocketbook at home. Meals, side trips, tips, berth and every other necessary expense are covered in the first cost.

WHEN—Leave home Saturday, July 26th; return sixteen days later, Sunday, August 10th.

Mail the Coupon below for Full Information, Schedule and Cost

Tour Manager, Pennsylvania Farmer,
7301 Penn Avenue, Pittsburgh, Penna.

Please send full information and illustrated booklet about the Pennsylvania Farmer Pacific Northwest Tour. This places me under no obligation of any kind.

Sweet Clover and Jerseys at Maple Dale Farm

By H. C. BARKER, Dairy Specialist,
University of Maryland.

FOR the last six years John Bay, Harford county, Md., has been supplementing his eight acres of permanent bluegrass pasture with sweet clover. Thirteen acres of such pasture carry his 25 milking cows through the summer. He has a twelve-acre piece of ground near his permanent pasture on which he maintains a two-year rotation of wheat or barley and sweet clover. A fence divides the piece into two six-acre fields, and one of them is sown to sweet clover each spring. The other six acres, sown to sweet clover the previous year, are used for early pasture. Mr. Bay turns his 25 cows on this six acres of sweet clover about the first to the 15th of May, and it carries them until about the middle of August.

The sweet clover is sown with barley or wheat and fifteen pounds of seed to the acre are used with an additional seed mixture of five pounds timothy, five pounds alsike and five pounds of red clover. "By using a mixture of this kind," says Mr. Bay, "I always get a good stand, and when the barley or wheat is removed at harvest time, the new seeding is soon ready to turn on to."

There are ninety acres in the Bay farm, sixty-five of which are tillable. Twenty-five head of milking cows and fifteen head of young stuff are kept. Mr. Bay's bluegrass pasture is considerably better than the ordinary run of pasture. His permanent pastures are top-dressed with manure every winter and limed about every fourth year. Speaking of sweet clover pasture Mr. Bay says, "I get more feed per acre from sweet clover pasture than any other crop that I grow on the farm. The dry weather does not seem to affect it."

Sweet Clover Provided Dry Weather Pasture

"I still can shout for sweet clover," says Mr. Bay, "even after such a dry season as 1929. On the 15th of May I turned my 25 cows on the six acres of sweet clover. This proved to be a little late, as the clover had made such a start that about two-and-a-half acres were hardly touched. On June 5th I ran the mower, with the cutter-bar set high, over this part of the sweet clover, cutting off the tops. This cutting induced the plants to put out new shoots, which proved a very good idea. My acreage of permanent pasture is very small, compared with the number of cows that I run on it. This pasture was very hard hit by the dry weather last season, yet my cows made out very well until after harvest."

"From the six acres of wheat sown with the sweet clover last year, I harvested thirty-three bushels of wheat per acre. As the season was unusually dry the clover was very small and I did not turn the cattle on it until August 15th. I believe I got as much pasture from it as in previous years, although it was small and the cows perhaps had to work harder to get it. My cows kept in fine condition and while I was not in the cow-testing association last year, my gross income from my herd was as good as it has been other years."

For several years Mr. Bay has been a member of the Harford County Cow-Testing Association. In 1927-28 his herd of 25 cows averaged well over 325 pounds of butterfat per cow. His grade cow "Brindle" was high cow in 1927, with 526 pounds of fat, and fourth in 1928 with 9,347 pounds of milk and 501.7 pounds of fat. She made a profit over feed cost of \$219.18. In 1928 the average "profit over feed cost" per cow was \$186.85. Only three other herds in the association were higher. He had one cow with over 500 pounds of fat, two with over 400 pounds of fat, and three two-year-old heifers that produced from 336.4 pounds to 356.7 pounds of fat for the year.

Mr. Bay is an enthusiastic Jersey breeder. He still has a few good grades, but most of his herd are registered Jerseys. The first pure-bred came to Maple Dale Farm, for that is the name of Mr. Bay's farm, in 1913. This was a registered Jersey bull from the farm of a prominent Harford county Jersey breeder. In 1927 a registered heifer was bought and later four more pure-bred Jerseys were added to the herd. No females have been bought since.

In 1923 six cows were put on Register of Merit test. Mr. Bay cared for these cows himself during the whole year, except one week when he was ill. Five of the six cows finished records with over 600 pounds of fat. One won a gold medal, one a silver medal and two won state championships. The sixth one was a two-year-old that made 399 pounds of fat in ten months.

Good bulls have always been used. Sid Sultan, a good son of Zenia's Sultan, was used for some time and left 21 fine daughters at Maple Dale Farm. Fairplay's Prince 233844, the present herd sire, is a son of Fairplay's Princess with 900 pounds of fat.

The cows have made Maple Dale Farm very productive. Last year from 16 acres of clover meadow 60 tons of clover hay were cut. Wheat is generally top-dressed with about 200 pounds per acre of a complete fertilizer, usually a 2-12-4 or manure, and yields 30 to 33 bushels per acre.

"If you want to get milk out of cows you must feed them," Mr. Bay told me when I asked him if he grazed his cows in summer. In spite of the good pasture the cows get one pound of grain to four and one-half to five pounds of milk. Most of the time he feeds a home ration, supplemented with 32 per cent feed. His grain mixture is 400 pounds of corn and cob, 300 pounds ground oats, 300 pounds bran, 500 pounds 32 per cent feed.

Two well-filled silos assisted by an abundance of clover hay of the right sort, furnish the winter roughage. Too often many of our good dairymen have been unable to get away from their old friend "timothy."

"You know," says Mr. Bay, "That timothy is no good for pasture and it is no good for hay, therefore, on a dairy farm it has no place."

The Marginal Farmer

THE newest and greatest danger to agriculture is the marginal farmer, a recently discovered but so far unclassified pest. Farmers have troubles enough, goodness knows. What with the

Mr. Bay holding his gold medal cow and former state champion Prozle's Tormentress

bean beetle, boll weevil, corn borer, fruit fly, army worms, Japanese beetles, grasshoppers, politicians, short skirts, and the like, the poor, deluded farmer has already had more than his share of woe.

And now the scientific sharps must go and dig up another menace!

When I first saw the term "marginal farmer" I was more than a little puzzled, and a whole lot scared. I had heard of lazy farmers, truck farmers, one-gallop farmers, skunk farmers, and a host of other kinds of farmers. But nary a marginal farmer.

I have heard farmers and their ways cursed and discussed from all possible angles. I have heard them called names that would scorch the bark off a tree and melt type metal. But like the profane old fish wife whom Charles Parnell rebuked by calling her a parallelopipedon, I had never been called such a vile name before.

So, in the interest of exact and scientific knowl-

edge, I beat it to the dictionary. I skimmed around awhile among the F's and M's, but this new menace was absent or not voting. I found "farmer" and I found "marginal," but I couldn't locate chapter or verse where the two had been joined together in the bonds of unholy matrimony, or worse. Finally, in desperation, I turned to the pictures in the back. But like Mark Twain I failed to free this conjugal anomaly even among the pictures.

Then I went back, and again read the accounts of the unearthing of the marginal farmer. I hoped in this way to learn what it all meant. I wanted to know, too, if we hayseeds had been insulted, I did, we were, and we are. I learned all this, and a lot more. Roy Chapman Andrews' story of his explorations in Mongolia has nothing on the marvelous tale of the finding of the marginal farmer. For breathless interest, red-blooded romance and unparalleled intrepidity, the discovery of the marginal farmer stands alone, unexampled and unsurpassed in the annals of science.

Details Announced Later

Being a little dull of understanding, like many other farmers, and slow to grasp printed matter unless it is in large type and words of one syllable, it took me some time to dig out the meaning of the term "marginal farmer." But I got it at last; and for the benefit of my fellow sufferers I am going to pass it along without charge.

It seems, as near as I can make it out, that marginal farmer is one whose income is too small to properly equip himself and family with an adequate supply of radios, silk socks, bath tubs, machine washers, eight cylinder cars, corn remedies, electric refrigerators and the other essentials of happiness. In other words, the marginal farmer is one whose acreage is too small or too worthless to make him a good customer for even a shoe-string peddler.

The absence of a radio seems to be the one sure sign of the outcast marginal farmer. That, or rather the lack of it, is what makes him a scorn and a hissing among all good men and true. Even hayseed in a six-week growth of whiskers is not so certain an indication of his depravity.

It is a gloomy situation; and only one feeble ray of light—it seems to me—that I have heard that phrase before—illuminates the Stygian darkness which encompasses the awful profundity of the subject: the eminent scientists who first uncovered this horrible menace have already worked out the treatment for it. Their plan is not patented, either; and I am free to reveal it: they are going to make the marginal farmer prosperous, and a good customer for everything from yo-yo's to airplanes.

And here's how they are going to do it. No halfway measures for the scientific mind. No indecency! If they cannot make the old M. F. over completely, from old chip hat to cowhide boots, with a close shave four times a week, they will have no further appeal to them. All or nothing is their motto! So—and here's the secret—they are going to move him off his worthless acreage and put him on land where he can make at least a net \$1,200 a year, and his eating tobacco!

So far, so good. Nothing is said as to how the M. F. is to be pried loose from his broomstick and sassafras plantation. Nor is anything said as to where the fertile, productive acreage is to be found. Nor who is to find it, and move the M. F. onto it. Nor how the present owner is to be separated from it, and why. These details will, doubt be worked out later—much later.

Charles H. Washburn

A view of Mr. Bay's homestead.

Milly Woodbridge's Trek to the Pacific

The Pioneers of the Peace River Valley

By C. A. Stephens

Copyright, 1930, by Capper-Harriss-Slocum, Inc.

SYNOPSIS

Two New England families, who have gone to the Peace River country in Canada to make homes, find themselves in unfortunate circumstances when the railroad, on which they had based their hopes, is not built near where they have settled. One of the families, the Mastermans, moves away, but the other, the Woodbridges, remains in the vain hope that something will happen to create business for the sawmill they have built. The son and daughter advise following the Mastermans' example and go back to civilization while they still have enough money to make the journey, but the father refuses to leave his mill. At last, when it became evident that they could not live through another winter on the Peace river, and after their money had been spent, they started to walk across the thousand miles of wilderness, and mountains that stretched between them and the Pacific Coast. With a horse, a cow and later an Indian woman who joins them they cross rivers and forests in slow but determined fashion, living largely on game and fish. The extreme exertion together with wet weather seem to make the father's cough worse until one day he has a hemorrhage of the lungs, losing considerable blood before it stops.

HERETOFORE Mr. Woodbridge's two children had not supposed his ailment serious; now they were but too certain that he was suffering from tuberculosis and that the disease was already far advanced. Something akin to panic fell on Milly. She reproached herself for inducing him to set off on so arduous a journey. As for Freeman Woodbridge, himself, all his remaining courage now left him. "I shall never see Prince Rupert!" he exclaimed despairingly. "This is my last journey. I shall die here among these dismal mountains."

"Would you like to go back to our place on the creek, father?" Milly asked him. "We will go back if you say so. Do you want to?"

"Oh, but we have come a dreadful long way," he replied. "I never could foot it all that long way back! I want to rest. Let me rest."

The July weather was far from cold; but he shivered as if chilly. Milly covered him warmly with two blankets and presently he fell asleep.

They did not move camp next day, nor the day following. Beaver abound on many small streams that enter the Finlay. On the second day they were there. Winthrop shot two young ones, which the squaw cooked after the Indian fashion for their dinner. They found the flesh very good eating. The elder Woodbridge had now so far recovered as to partake quite heartily of this new fare. Next morning he was visibly much improved. Better still, his courage had returned. They had not seen him in such good spirits since starting. He laughed and even joked at breakfast. "Let's be off from here," he exclaimed. "No good staying here. I'm all right." When again Milly asked him if he wished to return, he cried, "Not a bit of it! Prince Rupert, or bust!"

"I mean to start a mill there," he went on to say. "It's a growing young town. There's sure to be a great call for lumber."

They went on, much encouraged, Woodbridge, senior, leading the way with Winthrop and assisting him to clear the trail. That day they had to cross several small streams that enter the Finlay from the north. These they were able to ford at points where shallows favored a passage. In order not to expose the elder Woodbridge to danger of further colds from wet feet they first led the horse across, then having removed the packs, took the animal back for their father to ride through the stream. Although now the 9th of July, the water of these mountain creeks was cold from the snows at their sources. In nearly all of them, however, they were able to catch trout in abundance. Time and again, too, Pinky-Blue led the way to beaver dams and ponds at no great distance from the trail, where by watching awhile Winthrop succeeded in shooting one, sometimes two, of these industrious rodents.

In many other ways also they found the squaw an efficient helper. A day or two later, however, they lost her under rather queer circumstances. They had camped for the night on a little hillock near the Finlay and, while cooking their supper, were joined by an Indian who was descending the river in a canoe. Noticing their smoke he came ashore, and seeing the squaw with them, grunted a salutation, then sat down on a stone hard by. Evidently he was waiting an invitation to share their food; and when it was prepared, Milly signified to Pinky to offer him a platterful of such as they had also a dipperful of milk, which latter, however, he rejected with a gesture of disgust.

WHETHER this Indian had previously known Pinky did not appear. They seemed not to converse together, nor indeed to pay much attention to each other; none, in fact, that the Woodbridges noticed. The fellow was of unprepossessing countenance and appeared of a sullen disposition.

He lingered about and came to their camp early next morning to be fed again. After they had given him food, he rose as if to leave, but when a few steps away, turned and beckoned to the squaw. Without explanation or a word of farewell to her white friends, the faithless Pinky got up and followed him down to his canoe. Then, to their astonishment and much to Milly's regret—they saw the pair paddling away down the river. It had been a very laconic wooing—but successful!

"Well, that's the last we shall see of Pinky, I guess," Winthrop said, and so they supposed; but the sequel had yet to come.

Three days afterwards, while they were camping at the foot of a long rapid on the Finlay, Pinky-Blue came back to them—sometime during the small hours of the night. On emerging from the

tent the following morning, Milly espied her sitting huddled in her blanket, on the ground near the tree where old Peregrinations was tied. Her face was down in her hands again; and as before, she was the abject picture of desolation.

Milly's attempts to find out what had happened to her elicited but little information. The poor creature was woefully depressed—worse than before. Milly gained the idea that Pinky's new lord and master had failed to appreciate her, and had given her a beating—the upshot of which was that she had fled from him, taken the trail and come back to them.

As they were going on, the following morning, they were overtaken by two miners carrying packs, who had come up the Parnip River from Queen's in British Columbia, on their way to the Germansen gold mines. One of them was an elderly man, the other quite young, apparently not

The Cheerful Plowman

FARMERS AND COOKING

A FARMER should know how to cook without a boss, without a book, without a hitch of any kind, without a tremor of the mind. The wives of farmers, be it known, have kinks and troubles of their own. They have their social duties too, they must keep up with who-is-who, so there must come at times a day when they are ill or gone away.

I have an uncle, poor old skate, so helpless and so out of date, that when his wife is gone or ill he never gets a decent fill; he has to munch at crusts and beans and chew at old and mouldy greens. He could not make a bowl of soup to save himself from death or croup; he could not fry a piece of steak to save himself from chill and quicke. He's just as helpless as a child, and that is really speaking mild. If his wife should be gone a year he'd starve beside the stove, I fear.

Not so with me, I'll tell you those, for as a cook I often pose. When my wife wants to go away to some pert circle for a day, or wishes to take off a week and visit down at Potter's creek, I do not want her while away to worry for my sake, I say. I do not want her to be sad because my bill-of-fare is bad. I want her not to spoil her fun by thinking I am all undone. I want my wife when she is gone to have her finest graces on; I want her then to get a rest and not by breads to be possessed.

And more than that, when she returns to view her dishes and her urns, her kitchenware and frying pans which she left bright as nickel cans, I want her then to find them all as sleek and shining as the wall. I want her to come back and find her husband in his normal mind, as fat and dapper as a seal, the house all groomed from head to heel.

You bet this farmer here can cook without a note, without a book; his wife can go and come at will and find him neither starved nor ill. J. E. T.

more than eighteen or nineteen years old. These wayfarers continued with them throughout the day, bought milk and cream and camped near them that night. It was noticed that the younger one seemed attracted to Milly, though he appeared too bashful to say much. They were traveling faster than the Woodbridges and next morning shouldered their packs and went on. Presently, too, our friends made a start and had been on their way a few minutes, when they met the younger miner coming back to them, this time without his pack.

After joining them he walked beside Milly for a little way, then told her his name—Luther Martin—and asked hers. "My uncle and I have a good claim at Germansen," he went on to say. "I took out fifty ounces last season and this year I shall take out a hundred. If you will tell me where you are going, I'd like to come and see you"—and his eyes said much more!

Not to make a secret of their destination, Milly informed him that they were journeying to Prince Rupert. "But I am afraid it would be of no use for you to visit us," she added gravely.

The young fellow seemed disappointed and ere long went on without further conversation. Pinky who was a step behind, leading old Peregrinations, watched Milly with great interest all the rest of the day. It was some time, too, before Milly heard the last of young Luther Martin, from her brother Winthrop. "That was a pretty nice young fellow, Milly," he was wont to say teasingly. "You may not do better. Quin Masterman may have found another girl at Prince Rupert by this time. Shrewd girls, like good generals, always have a reserve handy!" To all of which badinage Milly paid but the slightest attention.

The next day, or the next but one, they reached the confluence of the Finlay with the Omineca, the latter a large and rapid river that enters the Finlay from the south; and as the trail henceforward was along the west bank of the Omineca, they had the Finlay to cross—a somewhat formidable undertaking.

Two days were occupied constructing a raft, for which dry logs were collected from ricks of driftwood along the river bank. For safety's sake two layers or platforms of the logs were laid one above the other, crosswise, and the structure held together by poles and ten spike nails, which Freeman Woodbridge had bethought himself to put in their outfit in case they might be needed for this purpose. The raft was made fifteen feet in length by ten in width, since it was necessary to ferry the Jersey across on it. The old horse, they found, would enter the water and could be led to swim behind the raft. Brighteyes, however, could not be induced to do so, and indeed they had difficulty in coaxing her to set foot on the raft.

At a short distance above the junction of the two rivers, the current of the Finlay is sluggish. They had laid their raft hereabouts, and by using long poles were able to cross and recross several times without serious difficulty or danger. Afterwards they knocked the spikes out of the logs and took them along for use again, if wanted. At the place where they crossed, the Finlay, they told me, was about seven hundred feet wide and so deep that in mid-channel the bottom could hardly be touched with poles fourteen feet long. For several days the trail along the Omineca proved more passable than the one they had followed by the Finlay. They made fourteen or fifteen miles daily, and on the fourth day reached the foot of what is known as the Black Canon, where the river comes down an impassable gorge.

THE trail round this chasm diverges for a considerable distance following about the base of a wooded mountain on the north side of the gorge. An entire day was spent exploring this detour in advance; and during the afternoon while Winthrop and his father were away doing so, the squaw and Milly had an alarming adventure.

Pinky had gone fishing in the pool below the craggy black gateway of the canon a short distance from their camp, while Milly was improving the leisure day to mend their clothes. As the squaw fished, she went slowly along the river bank and came at length where a projecting rock had to be climbed. Scrambling to the top of it, she was disagreeably surprised to find herself close upon a large gray bear with a cub, both greedily feeding from the carcass of a moose, which the mother bear or a passing hunter had killed. They were just the other side of the rock, not ten feet away. The roar of the water had prevented Pinky from hearing them, or they her.

The Farm Home

Clothes for the Boy

CLOTHES influence the character and happiness of children. Qualities of character that are very definitely affected by their clothing are self-reliance and independence. At a very early age—less than three years—a child can learn to dress and undress without help,—provided all his clothes are designed with this aim in view. A little patience will soon teach a small boy just how his trousers should be buttoned on the waist, if the fastenings are as simple as possible and placed where he can reach them. Besides developing independence, the ability to dress himself will save a great deal of time for the mother.

Many people believe that boys care little about their appearance, and point to their apparent indifference when they are playing actively in soiled or torn garments. If they were given suitable play-suits, however, they would not look so disreputable, and they would be equally happy in, and unconscious of, their clothing while at play. Being dressed for play, in any case, is quite a different matter from being dressed for appearance before other people—to go to school, for example, or to be taken to somebody's house. A queer or ill-fitting suit or one of an ugly color will make a little boy just as uncomfortable as his little sister would be under similar circumstances.

Children's Taste Is Reliable

Boys' clothes should be smartly masculine in cut and well tailored, but they may have plenty of color, according to what the child likes and what is becoming. Some children are very sensitive to colors, and this should never be ignored or ridiculed. Their likes and dislikes should be considered as far as possible. Usually children's taste in color is reliable, although a trifle primitive. With a little guidance in choice, they may receive much happiness from the color of their clothes, and at the same time develop good taste.

The suit illustrated was designed by a specialist of the Bureau of Home Economics of the U. S. Department of Agriculture, and is one of the very first the little boy will wear. The trousers are as simple and straight as possible and are carefully cut. The back seam is longer than the front, and gradually slants from the top to the crotch. This provides room for sitting. There is a front drop which is independent of the side placket. The little blouse has a collar trimming stitched flat, matching the trousers and cuffs in color. There is enough variation in the line of the bound front closing to make it interesting. To give room for activity in a blouse with long sleeves the waist must be a little loose through the body and under the arms. This extra width is slightly confined at the hips by buttons and loops so that it does not hang outward in front.

Happy the Modern Mother

TODAY the intelligent mother knows and profits by the information given her by the patient scientist regarding the health of her little one. She no longer swaddles her tiny tot away from the health-giving rays of the sun, but dresses him in the lightest of porous garments or perhaps no garment at all, and lets him kick delightedly for a while every day in the warm open sunshine. She helps prevent the dreaded bone disease of rickets by giving him cod-liver oil, and the little fellow learns to smack his lips over it.

She begins early to feed him diluted orange and tomato and cabbage juice to prevent scurvy. She feeds strained vegetables when he is several months old. She knows that she must sterilize the utensils in which she prepares the baby's food, must keep his bottles surgically clean and his milk cold until it is warmed for him, to help prevent dysentery and other ills. She may learn from her doctor how to regulate the richness of his milk to agree with him perfectly and prevent colic. She need never know the fatigue and strain of walking the floor night after endless night with a peevish baby. She realizes that perfect regulation of diet, schedule, bowels and sleeping hours all help to make her baby a happy, independent, strong little fellow.

Nor have the business men and manufacturers been slow to learn of the new needs of a mother and provide for them. She can buy many things to help her busy days with baby. There are the little seats which fit over any chair or car seat, so that mother and the baby may go out for a drive in the car all by themselves whenever they

Good Type of First Suit for the Small Boy.

wish. There are the strained vegetables and soups which come all ready prepared for baby's use. They save mother many hours of work, or are a boon when baby and mother are away from home, where it is difficult to cook and strain so carefully. She can buy little sun suits of soft net. And she can buy aluminum ventilated mittens to put on baby's hand as he goes to sleep, to prevent that little thumb from snuggling into his mouth.

Be glad you are a modern mother!
Marion Cossitt Brackin.

The Summer Fireplace

NOW that the winter is past and the hearthfire is dying what shall be done with the fireplace? An empty grate is desolate and cheerless. The old idea of sealing the grate with stiff paper or a board cut to fit the fireplace protected the carpet from showers of storm-blown soot but the arrangement reminds one of the proverbial bushel measure turned over a candle. The grate may be screened but there are objections here, too.

One spring evening after the house had been thoroughly cleaned and the fireplace barricaded with a piece of heavy furniture, the good man of a well-ordered home remarked as he sat down to read his paper, "Somehow it doesn't seem like home with the fireplace closed."

The hearth is the center of the home and should be made attractive in summer months instead of concealed as an unsightly thing. A whisk broom will free the back and sidewalls of loose soot; then every particle of ashes should be removed. (Wood ashes are splendid for the garden.) Soap-suds, ammonia and a stiff brush will clear the hearth and the face of the mantel, if it is brick.

Now throw into the grate a handful of wood shavings and a few splinters of kindling; then heap on a few slender birch or beech logs. If these light-colored woods are not available, any kind of split logs will make a pleasing contrast to the dark background.

Such a hearth is pleasant to look at and adds charm to a room. If on a cool evening a match is set to the shavings, chill and dampness will soon be replaced by warmth and cheer.

Marguerite Steele McCreary.

Setting Examples

ROSE-MARIE always came to school looking as clean and sweet as a fresh little rose. Her hair was well taken care of, her hands and nails in perfect condition, her little dresses free from spots and her shoes carefully polished.

One day, when she had remained after school to help me and had carefully washed her hands and brushed her dress before putting on her coat, I said, "Rose-Marie, I've watched you from the time you started to school—a bit of a fluffy baby in the first grade, and I've never seen you when you weren't as neat and immaculate as it is possible for a little girl to be."

Rose-Marie smiled, pleased with her teacher's praise. "Mother always looks nice and so does Daddy," she answered simply.

A few days later I had a chat with Rose-Marie's mother, repeating what her little daughter had said.

"My deeds have borne fruit," responded the mother with a happy chuckle. "You see, Miss Dorothea, I've always loved a clean, sweet little girl, and as I didn't want to preach and nag, Daddy and I have tried to set the right example. Children are very observant and quick to emulate those they love and admire. Oh, it hasn't always been easy,"—the mother seemed to be reading my thoughts. "It's such a temptation to let down. After a particularly strenuous day's work I often think, 'If only I could stay the way I am and dress.'"

Duty to the Others

"Yes, I know," I agreed, thinking of my often tired self after a difficult day at school.

"And then I'll say to myself," she continued, "No, I owe it to Daddy and Rose-Marie to bathe, comb my hair and slip into a fresh house dress. And it really is refreshing mentally, as well as physically, you know, Miss Dorothea."

"That's very true," I answered, "and I'm so grateful to you for telling me all this. I never realized before how much a parent's or a teacher's appearance means to a child."

"Yes," she replied, "we can't help being examples for our boys and girls. It's surprising what little 'copy-cats' children are. Rose-Marie often speaks of you. She notices your hair, your teeth and even the way you carry yourself. 'I want to look like Miss Dorothea, today,' she sometimes tells me. Another time, with a hug for me, she'll say, 'I want to look like my mother!'"

I went home that evening a very thoughtful "school marm," determined that I would remember that I was teaching not only "reading, writing and arithmetic," but many other things as well.

And a parent's influence? Well, its duration is exactly twenty-four hours long every day of the year—and year after year.—Helen Gregg Green.

Plant Salsify

WE belong to the number who must count every penny. We love oyster soup, but can not afford to buy oysters. For ten cents we can buy a pack of salsify seed, for a little work raise a nice long row in the garden, and as soon as we can get any plants out of the ground have the most delicious oyster soup imaginable. Scrape off the thin skin and hair-like roots, cut in slices, boil in salted water until tender, add milk, according to the size of your family, a chunk of butter, and eat with crackers. If you do not have it, do plant some this spring.

Florence C. Hebel.

A child should have at least two hours of outdoor sunshine daily, or its equivalent in cod-liver oil.

In the selection of a new rug, durability is one of the first factors to be considered.

Do not store articles of fur, woolen, feather, which you know will never be used.

Cheese is an excellent meat substitute because it is rich in protein and fat and contains calcium phosphorus and vitamin A.

Instead of discarding the large leaves of lettuce, wash them carefully, trim off the brown sections, shred with shears, and use as a garnish or as the salad foundation.

For Brother and Sister Also

No. 6409.—Ladies' apron frock. Cut in four sizes: small, 34-36; medium, 36-40; large, 40-44; extra large, 44-48 inches bust measure. A medium size requires 3½ yards of 35-inch material. Price 15c or two for 25c.

No. 6511-6463.—Jacket ensemble for girls. Cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38-inch size requires 2½ yards of material 39 inches wide. Dress 6463 cut in six sizes: 34, 36, 38, 40 and 44 inches bust measure. A 38-inch size requires 4½ yards of 39-inch material. Price 15c or two for 25c.

No. 6497.—Girls' dress. Cut in four sizes: 10, 12 and 14 years. To make the dress with the blouse of one material will require 4 yards 35 inches wide for a 12-year size. The dress alone 2 yards will be required. For the blouse alone 1½ yards will be required. Price 15c or two for 25c.

No. 6630.—Misses' dress. Cut in three sizes: 16, 18 and 20 years. A 16-year size requires 3½ yards of material 35 inches wide. Price 15c or two for 25c.

No. 6072.—Boys' suit. Cut in four sizes: 8, 10 and 12 years. A 6-year size requires 3½ yards of material for the blouse and 1½ yards of material for the trousers. Price 15c or two for 25c.

No. 6631.—Misses' dress. Cut in three sizes: 16, 18 and 20 years. A 16-year size requires 3½ yards of 35-inch material. Price 15c or two for 25c.

No. 6046.—Girls' dress. Cut in five sizes: 4, 6, 8 and 10 years. A 6-year size requires 1½ yards of 35-inch material. To make with bias binding requires 2½ yards

1½ inches wide. Price 15c or two for 25c.

No. 6589.—Girls' dress. Cut in four sizes: 2, 4, 6 and 8 years. A 4-year size requires 2 yards of 32-inch material. To trim with rosettes and lace edging will require 18½ yards. Price 15c or two for 25c.

No. 6730.—Girls' undergarments. Cut in six sizes: 4, 6, 8, 10, 12 and 14 years. An 8-year size in one material, (undershirt and bloomers) requires 1½ yards of 35-inch material. The shoulder straps of ribbon require ½ yard. Price 15c or two for 25c.

No. 6269-6067.—Coat ensemble for girls. Coat 6269 and dress 6067 are both cut in four sizes: 2, 4, 6 and 8 years. To make the ensemble for a 6-year size will require 4½ yards of figured material, and 2½ yards of plain material 36 inches wide. Two separate patterns 15c for each pattern or two for 25c.

No. 6493.—Ladies' apron frock. Cut in four sizes: small, 34-36; medium, 36-40; large, 40-44; extra large, 44-48 inches bust measure. A medium size requires 3½ yards of 35-inch material. Price 15c or two for 25c.

No. 6227.—Ladies' slip. Cut in four sizes: small, 34-36; medium, 36-40; large, 40-44; extra large, 44-48 inches bust measure. A medium size requires 2½ yards of material 36 inches wide or wider. Price 15c or two for 25c.

"IT PROFITS A FARMER to take such a Vacation Trip!"

Go on a real tour—at low cost—this fall!

IT'S natural for folks to long for a real change from everyday affairs. Why don't you plan to take one of the special trips for farmers now being arranged?

You can thrill to the West—see the range country—visit National Parks—see the East, the land of your forefathers, with its many points of beauty and historic interest. In cooperation with farm publications, railroads have made possible for you a big vacation trip at the saving of a great deal of money.

At really small expense, you get a

priceless return in enjoyment and pleasure—not to speak of educational benefit. You have the companionship of a congenial group of people. You learn something about the agriculture of other states. . . . You come back home happy and refreshed.

Farmers who have taken these trips are very enthusiastic. A flat sum usually covers all expense—with everything of the best. Plan this year to take that needed vacation and rest.

The Cattle and Hogs were Saved

A Bell System Advertisement

THE STRAW-STACK in the barnyard of a farmer living near Austin, Minn., fell over one morning and buried four valuable cows and several hogs. Calling his neighbors who had telephones, the farmer asked them to come at once to help save his endangered livestock. The neighbors began arriving with their pitchforks within a few minutes, and their combined efforts succeeded in digging out the cows and hogs without the loss of one.

A farmer living near Oconomowoc, Wis., one night noticed a car loaded with chickens in crates, standing along the road. Suspicious of thieves, he quickly drove to his home and telephoned his neighbors and the sheriff. The gathered farmers and deputies succeeded in capturing the thieves, and their arrest led to the breaking up of an organized gang of chicken thieves that had been preying on the surrounding country.

The telephone summons immediately aid to save lives and property, runs errands to town or about the countryside, and frequently pays for itself many times over by finding when and where to buy or sell.

The modern farm home has a telephone that serves well, rain or shine.

WHEN YOU BUY DIP

3 things

ARE MORE IMPORTANT
THAN THE PRICE YOU PAY

First—How strong is it? How does it compare with carbolic acid?

Second—Is it standardized? That is, will it run uniform, or does it vary in strength?

Third—What kind of emulsion does it make? Milky white? Free from any specks or oily streaks on the top, and free from settlings at the bottom? A poor emulsion not only denotes an inferior dip, but a waste to you.

Dr. Hess Dip and Disinfectant
IS FIVE TIMES AS STRONG
AS CARBOLIC ACID

It has a carbolic acid co-efficient of 5. That's why Dr. Hess Dip

Dr. Hess & Clark, Inc., Ashland, Ohio

costs less to use, no matter what price you pay for others. It requires less of it to make an emulsion.

Dr. Hess Dip is standardized, always the same, whether you buy it in Maine or Texas, the same yesterday, today and tomorrow.

Dr. Hess Dip makes the finest, whitest, milky emulsion of any dip that you can buy, and stays that way for weeks. The whiteness proves its worth.

Have your dealer place a teaspoonful in a glass of water—and see for yourself how much better it is.

Dr. Hess Dip and Disinfectant kills hog lice, sheep ticks and scab; destroys disease germs; keeps down foul odors; makes living quarters healthful.

Guaranteed.

The Story of Woodbine Farm

By W. D. ZINN

(Continued from last week.)

CHAPTER XV

IN the days when I was shipping livestock I was also buying all kinds of livestock and selling it to local butchers. Hogs were bought to be dressed and delivered to the railroad and I shipped them hither and thither.

One day in February I was in the city of Elkins and met a butcher whom I will call Smith. He said to me: "I want and must have three dressed hogs tomorrow. Can you furnish them?" I told him I had the hogs bought but I did not think I could get them killed, dressed and shipped on the next day.

About that time I saw approaching us a farmer of whom I had purchased some hogs to be killed when I wanted them. When Mr. Howell came up I told him what Mr. Smith wanted and asked him if he could deliver the hogs to Mr. Smith the next day. Mr. Howell lived several miles from the city of Elkins. The hogs had to be shipped by rail.

He said he could do it, but turning to Mr. Smith he said: "The hogs will not come in good condition, because they will not have time to cool and dry out before being shipped." To this statement Mr. Smith replied, "You need not be disturbed about that. Ship me the hogs."

Hogs Returned

Mr. Howell and I returned home on the same train that evening. When he left the train I said to him: "By all means do not fail to deliver the hogs to Belington in the morning in time for the up-train." Mr. Howell was one of those thorough-going, hustling farmers who never saw a task so hard that he would not undertake to perform it. Although he had six miles to haul the hogs after he had dressed them and had to have them at the station by ten o'clock, he was equal to the occasion.

By some hook or crook the agent failed to notify Mr. Smith the next day that the hogs had arrived and they lay at the station until the second day in the evening when Mr. Smith took them to his shop. The weather was very cold when Mr. Smith saw me on Monday and bought the hogs. Two days, however, had seen the temperature rise many degrees and Thursday was a spring day. The hogs lay on the floor in the shop until Thursday evening and Mr. Smith shipped them back to me by express.

I had been called to a funeral of a relative in an adjoining county. My wife, knowing nothing at all about the transaction, when the agent called her up and told her there were three hogs there which had been shipped to me and they were in bad condition, sent for them at once. The hogs were then badly tainted and hardly fit for soap grease.

Taken to Court

Upon my arrival home the following day, Friday, I called Mr. Smith up and asked why he had shipped me the hogs. His only reply was that he was not buying rotten meat. Although I did not like to go to law I felt that I was in no respect responsible for this loss and should not bear it.

I knew only one lawyer in Elkins at that time and to him I went for counsel. Much to my surprise, he frankly told me he had been engaged by Mr. Smith to defend him in the event I brought suit. I thought over the matter and concluded that it was such a clear case that I could win it without any counsel. I brought suit for the value of the hogs \$42.

Mr. Smith had taken every one he could get into his shop to see the bad condition of the hogs. When the day for the trial came, Mr. Smith had 23

witnesses present. Mr. Howell, whom I had purchased the hogs, son Hays, who hauled the hogs to the station, and Mr. Griffith, a son-in-law who helped to butcher the hogs, were my witnesses. It was no trouble to prove by these three witnesses that the hogs were in a healthy condition and that they were dressed and started for the station by 8:30 on Tuesday morning. Hays Howell swore that he unloaded the hogs in the car.

"In the mouth of two or three witnesses every word shall be established," but I had proved by only one witness that the hogs had been unloaded on time. If I had only had one other witness to corroborate what young Howell had said about loading the hogs from the wagon into the car. The agent at Belington, the local station, was the man I needed. Calling Mr. Howell to one side I told him to go and call Mr. Campbell, the agent at Belington, and insist that he come on the next train. Mr. Howell hastened to do what I requested, but it was time for the train to leave Belington.

The Missing Link

In a few minutes my nerves were settled by being told by Mr. Howell that he reached Campbell just in time for him to board the train. The defense was through with its 23 witnesses. It was five o'clock and the lights had been turned on. What could I do to continue the case for an hour? A hundred times during the day I had wished for a lawyer to help me.

Some of the witnesses for the defense had sworn that they believed the hogs had been dead for a week, had made out a good case, but there was one missing link. That link was to connect the wagon with the car at the siding at Belington. In order to kill time I had a summons issued for a man living out of town and the constable was instructed to find him and bring him into court if possible. My friend, the lawyer for the defense, began to insist that the plaintiff rest the case and it took no little argument to convince the court that it should not be done.

The blowing of the whistle announced the fact that the train was coming into the station. Mr. Howell, who had been doing all he could for me all day, was dispatched to the station in post haste to meet Mr. Campbell and find out from him just what he knew about the case.

Continue the Case

When Mr. Campbell came into the court room, I asked that he might be sworn, to which the lawyer objected, stating that he had not been summoned, which objection was overruled by the court. Mr. Campbell stated that he helped to load the hogs that they were still bleeding and that the train left on time.

I asked, "If the train had not reached Elkins that night would you agent have been notified?" He said he would. "You received no such notice?" To which question Mr. Campbell replied, "I did not." It was now 6:30 p. m. and I was never more nearly worn out. I suggested to the lawyer that we submit the case without arguing it.

My friend said Mr. Smith would never forgive him if he did so but that he would ask the Court to continue the case until nine o'clock the next morning. This the Court did. I went to the hotel, got a room and retired at ten o'clock. It was another of those nights in my life that I could not sleep. I tried in vain until midnight. I got up, turned on the lights and from that hour until seven a. m. I worked on the case.

Suspicious of thieves, he quickly drove to his home and telephoned his neighbors and the sheriff. The gathered farmers and deputies succeeded in capturing the thieves, and their arrest led to the breaking up of an organized gang of chicken thieves that had been preying on the surrounding country.

The telephone summons immediate aid to save lives and property, runs errands to town or about the countryside, and frequently pays for itself many times over by finding when and where to buy or sell.

The modern farm home has a telephone that serves well, rain or shine.

WHEN YOU BUY DIP

3 things

ARE MORE IMPORTANT
THAN THE PRICE YOU PAY

First—How strong is it? How does it compare with carbolic acid?

Second—Is it standardized? That is, will it run uniform, or does it vary in strength?

Third—What kind of emulsion does it make? Milky white? Free from any specks or oily streaks on the top, and free from settlements at the bottom? A poor emulsion not only denotes an inferior dip, but a waste to you.

Dr. Hess Dip and Disinfectant
IS FIVE TIMES AS STRONG
AS CARBOLIC ACID

It has a carbolic acid co-efficient of 5. That's why Dr. Hess Dip

Dr. Hess & Clark, Inc., Ashland, Ohio

costs less to use, no matter what price you pay for others. It requires less of it to make an emulsion.

Dr. Hess Dip is standardized, always the same, whether you buy it in Maine or Texas, the same yesterday, today and tomorrow.

Dr. Hess Dip makes the finest, whitest, milky emulsion of any dip that you can buy, and stays that way for weeks. The whiteness proves its worth.

Have your dealer place a teaspoonful in a glass of water—and see for yourself how much better it is.

Dr. Hess Dip and Disinfectant kills hog lice, sheep ticks and scab; destroys disease germs; keeps down foul odors; makes living quarters healthful.

Guaranteed.

The Story of Woodbine Farm

By W. D. ZINN

(Continued from last week.)

CHAPTER XV

IN the days when I was shipping livestock I was also buying all kinds of livestock and selling it to local butchers. Hogs were bought to be dressed and delivered to the railroad and I shipped them hither and thither.

One day in February I was in the city of Elkins and met a butcher whom I will call Smith. He said to me: "I want and must have three dressed hogs tomorrow. Can you furnish them?" I told him I had the hogs bought but I did not think I could get them killed, dressed and shipped on the next day.

About that time I saw approaching us a farmer of whom I had purchased some hogs to be killed when I wanted them. When Mr. Howell came up I told him what Mr. Smith wanted and asked him if he could deliver the hogs to Mr. Smith the next day. Mr. Howell lived several miles from the city of Elkins. The hogs had to be shipped by rail.

He said he could do it, but turning to Mr. Smith he said: "The hogs will not come in good condition, because they will not have time to cool and dry out before being shipped." To this statement Mr. Smith replied, "You need not be disturbed about that. Ship me the hogs."

Hogs Returned

Mr. Howell and I returned home on the same train that evening. When he left the train I said to him: "By all means do not fail to deliver the hogs to Belington in the morning in time for the up-train." Mr. Howell was one of those thorough-going, hustling farmers who never saw a task so hard that he would not undertake to perform it. Although he had six miles to haul the hogs after he had dressed them and had to have them at the station by ten o'clock, he was equal to the occasion.

By some hook or crook the agent failed to notify Mr. Smith the next day that the hogs had arrived and they lay at the station until the second day in the evening when Mr. Smith took them to his shop. The weather was very cold when Mr. Smith saw me on Monday and bought the hogs. Two days, however, had seen the temperature rise many degrees and Thursday was a spring day. The hogs lay on the floor in the shop until Thursday evening and Mr. Smith shipped them back to me by express.

I had been called to a funeral of a relative in an adjoining county. My wife, knowing nothing at all about the transaction, when the agent called her up and told her there were three hogs there which had been shipped to me and they were in bad condition, sent for them at once. The hogs were then badly tainted and hardly fit for soap grease.

Taken to Court

Upon my arrival home the following day, Friday, I called Mr. Smith up and asked why he had shipped me the hogs. His only reply was that he was not buying rotten meat. Although I did not like to go to law I felt that I was in no respect responsible for this loss and should not bear it.

I knew only one lawyer in Elkins at that time and to him I went for counsel. Much to my surprise, he frankly told me he had been engaged by Mr. Smith to defend him in the event I brought suit. I thought over the matter and concluded that it was such a clear case that I could win it without any counsel. I brought suit for the value of the hogs \$42.

Mr. Smith had taken every one he could get into his shop to see the bad condition of the hogs. When the day for the trial came, Mr. Smith had 23

witnesses present. Mr. Howell, whom I had purchased the hogs, son Hays, who hauled the hogs to the station, and Mr. Griffith, a son-in-law who helped to butcher the hogs, were my witnesses. It was no trouble to prove by these three witnesses that the hogs were in a healthy condition and that they were dressed and started for the station by train on Tuesday morning. Hays Howell swore that he unloaded the hogs in the car.

"In the mouth of two or three witnesses every word shall be established," but I had proved by only one witness that the hogs had been unloaded on time. If I had only had one witness to corroborate what Mr. Howell had said about loading the hogs from the wagon into the car, the agent at Belington, the losing station, was the man I needed. Calling Mr. Howell to one side I told him to go and call Mr. Campbell, the agent at Belington, and insist that he come on the next train. Mr. Howell hastened to do what I requested, but it was time for the train to leave Belington.

The Missing Link

In a few minutes my nerves were settled by being told by Mr. Howell that he reached Campbell just in time for him to board the train. The defense was through with its 23 witnesses. It was five o'clock and the lights had been turned on. What could I do to continue the case for an hour? A hundred times during the day I had wished for a lawyer to help me.

Some of the witnesses for the defense had sworn that they believed the hogs had been dead for a week. I had made out a good case, but there was one missing link. That link was to connect the wagon with the car at the siding at Belington. In order to kill time I had a summons issued for a man living out of town and the constable was instructed to find him and bring him into court if possible. My friend, the lawyer for the defense, began to insist that the plaintiff rest the case and it took no little argument to convince the court that it should not be done.

The blowing of the whistle announced the fact that the train was coming into the station. Mr. Howell, who had been doing all he could for me all day, was dispatched to the station in post haste to meet Mr. Campbell and find out from him just what he knew about the case.

Continue the Case

When Mr. Campbell came into the court room, I asked that he might be sworn, to which the lawyer objected, stating that he had not been summoned, which objection was overruled by the court. Mr. Campbell stated that he helped to load the hogs that they were still bleeding and that the train left on time.

I asked, "If the train had not reached Elkins that night would you and agent have been notified?" He said he would. "You received no such notice?" To which question Mr. Campbell replied, "I did not." It was now 6:30 p. m. and I was never more nearly worn out. I suggested to the lawyer that we submit the case without arguing it.

My friend said Mr. Smith would never forgive him if he did so but that he would ask the Court to continue the case until nine o'clock the next morning. This the Court did. I went to the hotel, got a room and retired at ten o'clock. It was another of those nights in my life that I could not sleep. I tried in vain until midnight. I got up, turned on the lights and from that hour until seven a. m. I worked on the case.

Farm Engineering

By R. U. BLASINGAME

Three Plow Shares

WERE dynamiting some stones out of a field last week and found three plow share points under one stone. The farmer who owned the farm said that rock cost him many times what it cost to blow it out. It took 25 cents worth of dynamite to get rid of the stone, which is about one-third the cost of one cast plow share.

I believe the next move in land reclamation is going to be in the East, clearing land of rocks which interfere with power farming equipment.

Tight stones interfere with plowing, cultivation, potato digging and other operations. After stones have been blasted out they can be loaded on a stone-boat and hauled away either by a team or a tractor.

Kerosene Good Cleanser

MANY women do not appreciate the virtues of kerosene as an aid in household cleaning. A tablespoonful in the water for washing windows cuts grease easily and leaves the glass bright and clear. For cleaning sinks, bathtubs, lavatories and so on, nothing is better than a little kerosene mixed with whiting or some fine scouring powder.

A little kerosene in water helps the daily cleaning of kitchen and bathroom and laundry equipment, as this will remove dirt and grease without hard rubbing. This is also good for washing painted woodwork and walls. A cloth moistened with kerosene keeps the stove in good condition, but should not be used when the stove is hot or there is fire in it.

Good dustless dusters can be made by soaking clean cloths in a quart of water in which a tablespoonful of kerosene has been dissolved, and then drying them. Cloths so treated must be kept away from fire, and in all handling of kerosene it should be kept in mind that it is highly inflammable.

Speed for Good Work

A READER writes for information about a hitch for pulling a cylinder disk plow with eight horses instead of a tractor. It should be kept in mind that the work done by this type of plow is more dependent on the speed at which it is pulled than is the case with moldboard plows.

A higher speed than is possible with horses is often desirable and hence these plows are better adapted to tractor than to horse operation. However, the manufacturers of disk plows are probably the best judges as to how such plows will operate with horse power under your soil and moisture and wheel conditions, and hence I suggest you take this up with the firm manufacturing your outfit.

This same factor of the proper speed for best operation is also important with other farm machines, especially with the rotary hoe. D.

Glued Joints

THE search which wood experts have been making for many years for a glued joint that would resist moisture indefinitely seems nearly finished. Engineers from the Forest Products Laboratory took casein-glued plywood, treated some of it with creosote and the rest with beta-naphthol in oil, and exposed it to dampness and mold in a fungus pit. Specimens taken from the treated plywood after two and one-half years in the pit showed an average strength of about 80 per cent of that when put in. Such an exposure is far worse than joints are likely to meet even under the worst practical conditions. I. W. D.

E NOW! Eastern Farmers adopt a Western Feeding Practice

Chopped Hay

Gains Favor as Practical Method for Increasing Milk and Beef Production—Decreasing Handling, Storage and Feed Costs.

CHOPPED hay—universally popular in the great dairying and cattle producing states of the far West—is meeting with instant approval wherever it's tried in the East. Long hay—with its wasteful bulk and high cost of handling—is doomed.

Dairy and stockmen of California, Washington, Oregon and Idaho first experimented with chopped hay to make their legumes take the place of as much high-priced grain as possible. What happened? They got more consumable feed from the same acreage—more milk and beef from each ton of hay. And this at no more cost than the old method.

Cheaper to Handle

With this method hay is raked, cured and loaded in the field as usual. The load is then fed to a Papee Hay Chopper and blown into the barn. With 3 men pitching to the chopper, the load is off in from 10 to 12 minutes. No one needed in the barn to tramp or "mow back." Foster S. Reese, Benson, Utah, writes: "We ran into the barn 24 loads of about a ton each in 1 1/2

hours. This is 8 loads better than our best half-day run with the fork."

Takes Less Space

The moment you chop hay you double the capacity of your hay barns, for chopped hay saves from 1/2 to 2/3 your space.

Stock Eat it All

20% to 30% of the long hay you feed is wasted. But chopped hay is more palatable and stock clean it up like grain. Think what this means! You feed more stock with the same acreage. . . Increase milk flow or weight gains by enabling the same stock to consume more feed. And these are proven facts—not theories.

Less Spoilage

Chopped hay has less tendency to spoil, burn or mold in the mow or stack. In some instances long hay that has spoiled can be run through the chopper and rendered palatable to the stock.

Easier to Feed Out

You know what a back-breaking job it is to fork out long hay once it is settled in the mow. Chopped hay is easy to fork. Many farmers handle it in baskets, like silage.

1 Machine Serves Two Purposes

The Papee Hay Chopper is also an efficient ensilage cutter. You can chop and store your hay—then the same machine without alterations fills your silo with corn. Another worthwhile economy.

Right now, before the haying season starts, is the time to learn all about this feeding practice that enables farmers everywhere to make a profit in spite of markets. Ask us for the book, "A Better Way to Put up Hay." It's full of facts and figures that are sure to surprise you. And it's free to you.

8 BIG ADVANTAGES

1. Eliminates feeding waste
2. Increases milk production
3. Makes faster weight gains
4. Costs no more to put up
5. Easier and cheaper to feed out
6. Takes only half the storage space
7. Keeps better in mow or stack
8. Increases the net return per acre

53 More Bu. of Potatoes

Pay for Spray Material

and Show Extra Profit..

CHALLENGED to make a convincing test of Pyrox in comparison with bordeaux, George S. Ranck, of New Holland, Pa., made such a test on his farm. The results showed that the acre of potatoes sprayed with Pyrox yielded 53 bushels more than the acre sprayed with bordeaux. The fine Pyrox spray gave better protection against blight. Mr. Ranck writes:

"In discussing Pyrox with your dealers, A. B. Groff and Son, at New Holland, a challenge developed which resulted in my making a test of Pyrox and home-made bordeaux sprays on my farm this past season.

"A two-acre plot with uniform soil was selected and one-half was sprayed with bordeaux mixture 8 times and the other half with Pyrox 8 times. All other conditions—preparation, seed, time of planting, and cultivation—were the same.

"Potatoes from test rows in each plot were weighed at digging. The acre sprayed with Pyrox yielded 53 bushels more than where home-made bordeaux was used, the yields on the two plots being 337 bushels for Pyrox and 284 for the bordeaux mixture.

"During the growing season the fine Pyrox spray gave greater protection against blight, as all the leaf surface was covered. Better protection, increased yields per acre, and lower cost of production all help to make greater profits."—GEORGE S. RANCK.

Another Grower Gets \$97 per Acre Extra Profit

Another Pennsylvania grower who has made extra cash from potatoes by using Pyrox is Mr. Miles B. Landis, of Lancaster, Pa., who got \$97 per acre increased profit with Pyrox last season. He writes:

"Before this year I have al-

Mr. George S. Ranck of New Holland, Pa., exhibiting Pyrox-protected potatoes which yielded 53 extra bushels per acre.

ways used a regular bordeaux mixture. This year I tried Pyrox and certainly feel well satisfied with it because of its time and labor saving qualities. I further believe that I get a better control of disease and insects with Pyrox.

"The quality of my potatoes this year was very high. I am getting a premium of ten cents per bushel over the regular price here. I figure that my increased yield due to Pyrox was 45 bushels per acre."

MILES B. LANDIS
November 5, 1929

These big extra profits are possible because Pyrox, the scientifically-prepared all-purpose plant spray does three things at once. It kills bugs, prevents blights, and other diseases, and stimulates plant growth. Reduces production costs. Does away with the costly labor and doubtful results of home-made spray mixtures, and eliminates all danger of "burning" and other damage from improperly mixed chemicals. Easy to use. Gives the finest mist—will not clog nozzles. Sticks like paint to plants. Now priced lowest in 31 years. Write us or ask your dealer for a copy of the free Pyrox Spray Guide.

Mouse Injury

I have some eighteen apple trees about fifteen years old. The bark has been chewed off by field mice. Would you kindly tell me what to do with them?

In the fall when we pick our apples they have worm holes in and are knotty. They look as though they have been stung. What would you advise?
Ephraim W. Moyer.
Northampton county, Pa.

THE usual procedure is to bridge graft the injured trees. Long cions are cut, and sharpened at each end; one end is inserted beneath the bark above the wound and the other below the wound. They are held in place with small brads and the ends are waxed over. The details are given in Circular 103, "Budding and Grafting," published by The Pennsylvania State College.

However, it is now too late to bridge graft unless the cions were cut last autumn or during the winter, and were held in a dormant condition in the cellar or buried in the ground, or in cold storage. If dormant cions can be secured, bridge grafting may be done up until June first. If not, paint the wounds with liquid grafting wax or melted paraffin, and mound up the soil over the injured portion. This will keep the wound moist and favor healing. It would be advantageous, also, to cut back the trees heavily, and to give them a liberal application of manure or nitrogenous fertilizer.

Your apples evidently are attacked by the codling moth, which makes apples wormy, and by the red bug curculio or rosy apple, which makes them knotty. S. W. F.

Trees Winter Killed

We have trouble with young apple trees. Quite a lot of them have winter killed or something. The bark is dead just under the ground. We had old papers around them this winter to keep the mice and rabbits from eating them. They appear to be coming out in leaf. Are about three years old. Is it practicable to bridge graft them?
Tauphain county, Pa. E. F. Fulton.

NOTHING can be done for these trees except possibly to give them a stimulant of nitrate of soda, or other nitrogenous fertilizer.

Crown injury is a common form of winter killing, especially when the trees grew quite rapidly the previous fall and the wood went into the winter in an unripened condition. It also appears when the trees stand in loose soil and are swayed by the wind, so that there is a crack around the crown; water settles in the crack, freezes, and the bark is killed at that point, while the bark of the roots below and the top above is green and healthy. You cannot cut these trees back, because the injury is below the radicle and the renewal growth would be merely the seedling root stock. S. W. F.

Peach Tree Borers

Was waterwashing with lime hurt five-year-old peach trees? Will it kill peach borers? Walter Kusselman.
Jefferson county, Pa.

WHITWASHING will not hurt five-year-old peach trees; neither will it help them materially. It will not kill peach borers.

The old method of digging out the borers in May and October is still effective, but expensive. It has been replaced very largely by the use of paradichlorobenzene. This may be bought, under several trade names, at most drug or hardware stores.

Mound fresh soil around the base of the tree, several inches high in September or early October. Sprinkle one-fourth to one ounce of the chemical around each tree, according to the size of the tree; one-half ounce should be sufficient for five-year-old trees. Apply it in a narrow ring about an inch from the trunk; the material should not touch the trunk. Throw a few shovelfuls of loose soil over it and tamp this down with the shovel. The mound should be leveled off the next May or June. S. W. F.

Eureka

SPRAYERS

Traction or Power

Do the biggest, most important job in raising field crops and fruit. Increase yield 50 to 200 per cent. Improve quality. Insure investment by destroying bugs, preventing mold and blight.
Traction Sprayer has 1, 2 or 3 nozzles per row; 4, 6 or more rows per boom. Wheels adjustable to width of rows. 60 to 100 gal. tanks. Double or triple action pumps. Thousands of satisfied users.
Combination and Power Sprayers for orchards, groves, and field crops, have 3 cylinder pump-pressure regulator; several sizes of engines and tanks for pressures 20 to 40 lbs. with spray booms and guns.

In stock near you. Write for Catalog on Eureka Sprayers

Transplanted STRAWBERRY PLANTS
Best for May, June and July. Planting just as good as 1st year. Also Blackberry, Raspberry and other fruit plants. Strawberry plants from \$1.00. Strawberry plants from \$1.00. Strawberry plants from \$1.00.
Box 270, Pulaski, N. Y.

Truck Crops

By GILBERT S. WATTS

"MR. JOHN J. CONSUMER, Park Avenue or Main Street, America, buys vegetables on appearance and remains sold on quality." That is quoted from the Western Grower and Shipper, the official publication of the Western Growers' Protective Association. That our western friends appreciate the strength of this team, Appearance and Quality, is proved by the fact that California, which produced but one per cent of the total carrot shipments of carrots in 1921 and 1922, produced 53 per cent of such shipments in 1929.

Incidentally, shipments of carrots last year reached a total of nearly 12,000 cars. This vegetable is gaining in popularity at an astounding rate. "Miss Goldie Carrot," to quote again, has become well known and is liked throughout the land.

"PLEASE advise if it pays to save or raise your own garden seeds." Mr. W. H.

In college I asked that question of an experienced grower-professor. He replied with the query, "Are you sure you have any strains that are superior to those which you can buy from reputable seedsmen?" In fact wonderfully fine seeds are available at prices which scarcely cover the cost and pains of home saving.

On the other hand there are compensations in growing vegetables from seed that one has selected in his own garden. Sweet corn, tomato, pepper, eggplant, cucumber, squash and melon seeds may be saved with little trouble. But to go back to the professor's remark, if our efforts are to be really worth while care must be exercised to begin with fine strains.

"HERE'S twenty cents for a squash I bought last fall. This is my first trip past your market since you opened this spring." On the rare occasions when a customer at the roadside market makes a purchase and finds the pocketbook forgotten or empty we never inquire the name or enter a charge. Thus the opening of a credit business is avoided and I am sure we never have lost enough to buy a bookkeeper's ledger.

WITH the sun now as high in the heavens as in early August surprising quantities of water are required, particularly on windy days, to keep the vegetable plants under glass growing without check. Where water applied by one man in an hour or two daily was ample a month ago two of us frequently must water during several hours now. Even so I am inclined to believe that some of our celery plants have been held back more or less by deficiency of moisture.

TO ward off attacks of maggots in the late cabbage plant beds drench the soil along the rows at intervals of eight to ten days with corrosive sublimate, one ounce dissolved in ten gallons of water.

To Protect Tomato Plants

THE supply of early canhouse tomatoes is limited, a situation which makes urgent the need to protect the plants both before and after they are set in the field.

Cut worms may be destroyed through the use of a poisoned bran mash, according to C. H. Nissley, New Jersey extension specialist in vegetable growing. To prepare such a mash, first make a dry mixture of 20 pounds of bran and one pound of fresh Paris green. Then mix two quarts of cheap molasses with the juice of two or three lemons and about three and one-half gallons of water. All of these materials are next combined to make a wet mash. As cut worms are active only at night, the bran mash should be broadcast, or small quantities placed near the plants, in the evening.

HALF WAY LUBRICANTS WON'T DO IN A TRACTOR

YOU can't always tell the difference between a good lubricant and a poor one in an automobile running on a paved highway. But you can easily spot the difference between good oil and half-good oil in a working tractor!

For a tractor plugging its way through dust and dirt—plunging up and down the uneven ground which you find even in the most level field—working in the blazing sun and the chilling rain—puts lubrication to a more severe test than any automobile.

That's why you'll find AMOCO TRACTOR OIL making such strides with farmers who figure costs closely. There's a grade for every make and model of tractor—a grade that will keep each tractor at top-notch efficiency all day and every day!

AMOCO MOTOR OILS and Greases, too, for better lubrication of passenger cars and trucks.

Ask your AMOCO dealer, call our nearest branch or write us direct for further information.

THE YOUNG PEOPLE

Why I Want to Go to School

First Prize

I THINK we should try to impress on every farm boy and girl the importance of an education and steady attendance at school. Too many are kept home for the least little reason and merely put in their time at school until they are sixteen and can quit and work on the farm.

They do not realize that an education is needed there just as much as in any other station of life and if they intend to farm they should educate themselves for that, not just jog along as their grandfathers did before them.

The world is too far ahead of those times and if we ever expect to get any place we will need all the education we can get to keep up with the progress in all the other walks of life.

Yours for more schooling for farm children. Gray Foster.

Pennsylvania.

Second Prize

I want to go to school because the one with an education is usually successful in life. When we dig down to rock bottom we find there are four real reasons for us to attend school. We owe it to ourselves, our family, our community and our country. If we do not attend school, some one else may follow our example. If every one felt this way we would not have any school—especially high school.

Therefore, if there were no foundation for further study, progress and growth in the world would stop. Going to school does more than just help you earn more money; it also helps develop your mind. Many employers would reason that if a boy was not ambitious enough to go to school he would not be a very industrious worker.

Think it over! Is it worth your while to go to school?

Pennsylvania. Carl Buck.

Additional prizes have gone to Jane Cape, Marion Bender and Elizabeth Keener, all of Pennsylvania.

PRIZE LETTER

YOU want some suggestions about how to improve the Young People's page. That is hard for me to give. I don't see anything wrong with it the way it is now. The poems, drawings, puzzles, pictures and contests give us something new to look forward to each week. The instructions on how to make toys and useful things are also helpful.

I'm glad you let us have a part in making the page ourselves when you give us a chance to draw, write or solve puzzles. The only change I can see that the page needs is to have more letters and stories by the young people. I enjoy reading letters written by other young readers more than most anything else, and I'm always glad when you give us a page of letters and snapshots or real people.

The answers to the puzzle are given below. Bonnie M. Davison.

West Virginia.

Answer to A B C Puzzle

The farmer leads no E Z life.
The C D sows will ret;
And when at E V rests from strife
His tones all A K let.

In D D has to struggle hard
To E K living out;
If I C frosts do not retard
His crops, there'll E A drouth.

The hired L P has to pay
Are awful A Z too;
Try C K rest when he's away.
No N E work will do.

Farm N Z cannot make to meet
And then for L P takes
Some readers who so B T eat
And E for money makes.

Of late V C find his life
Such an old A G life;
The girls he O Z leaves his wife,
And then in P C dies.

The old farm needs some stables,
The old house needs some paint.
The front porch steps are broken.
A hinge is off the gate.

The old man's gone a-dishin',
The carpets on the line.
The hired girl's a-dishin',
An' her house-cleatin' time.

And her dithin' with the butter
An' Bud won't do a thing.
The baby has the colic—
Don't talk to me of spring!

Contributed by Flora Williams.

Have You Won a Prize?

SUCH nice letters as I find in my mail every morning! I wish I could put them all on our page for you to see, too. Don't get discouraged if your contribution doesn't appear the first week or even the second week after you sent it. It doesn't mean that I didn't appreciate it; just that we didn't have space. Try again—and even again—and perhaps your contribution will be just the thing we have been looking for.

Even if we can't have more space, we can be a little more discriminating in using the best that we have. So let us all try to make the Young People's page a "big" page within the boundaries the editors have allotted us.

This is your page and it is up to you to fill it with the very best stories or pictures you can send. Everybody may join in the fun and share in the fine prizes given each week.

Try your hand at these contests; send your letter before May 31st to Young People's Editor, Pennsylvania Farmer, 7301 Penn Avenue, Pittsburgh, Pa.

Three prizes each for the best cartoons on—

1. The Kicking Cow.
2. The Batty Mule.
Three prizes each for the best letters on the following subjects:—

1. Who Would You Rather Be if Not Yourself?
2. My Most Exciting Adventure.

—Young People's Editor.

"SPRING FAIRIES"
By BARBARA E. SHOEMAKER

The blossoms were waving—
All white in the breeze.
When down came the fairies
To play in the trees.

They danced in the sunshine
So happy and free,
Sung songs to the blossoms
And chased a poor bee.

A few crystal rain drops
Which had chanced to roam
Came pattering down
And the fairies ran home.

THE LAST DAY OF SCHOOL
Mamie Stoltzfus, Pennsylvania.

Picnic Games
The Sack Race

JUST the plain old-fashioned sack race, in which contestants have both legs in a sack and must run to the goal and return, thus impeding.

Excitement is added if the relay plan is used, whereby each runner must on returning to the starting point, take off his sack and give it to the other runner of his team! When one is in a hurry that is a very easy thing to do!

THE SACKS
Runners are given sawed-off broomsticks which they are to put under their bent knees. They are to keep them there while they race, inch by inch, to the goal and back. The course should be a short one.

THE SQUATTERS' RACE
Runners bend knees, squat on heels, and with hands on hips, go to the goal and return at a whirlwind pace—mayhap! What is more, nothing is said to them about the way they will undoubtedly feel the next morning! One should be merciful and make this course, too, a short one.

THE SURE SIGNS
The old farm needs some stables,
The old house needs some paint.
The front porch steps are broken.
A hinge is off the gate.

THE OLD MAN'S GONE A-DISHIN',
The carpets on the line.
The hired girl's a-dishin',
An' her house-cleatin' time.

And her dithin' with the butter
An' Bud won't do a thing.
The baby has the colic—
Don't talk to me of spring!

Four-H Club Attend Camp

THE Fourth National Boys' and Girls' Four-H Club Camp will be held in Washington, D. C., on the grounds of the Department of Agriculture, June 18 to 24.

Pennsylvania's delegates to this important event have been selected. The home-making club members will be represented by Edna Hower, of Northampton county, and Madelon Stitt, Juniata county. The agricultural club members will be represented by Harry L. Smith, Union county, and Herbert K. Anders, Montgomery county.

Edna Hower has been in club work since 1926. She has been in a potato club, sewing club, canning club, and My Own Room Club. All this has been done in addition to home responsibilities as the oldest one of nine children.

Profitable Work

Madelon Stitt also started her Four-H Club activities in 1926. She has completed three years of sewing club work and one year of My Own Room Club work. She will go into nurse's training on completing high school. Both girls have acted as leaders in their clubs.

Harry Smith grew 458 bushels of potatoes to the acre in 1928, and has engaged in dairy calf club work for three years. Herbert Anders has been a Guernsey calf club member since 1923. They have found it profitable to be Four-H Club members and have savings accounts as a result of their work. Both boys have represented their counties at Young Farmers' Week at State College. Each has been president of his club. Herbert has acted as assistant local leader of his club since 1928.

Little Folks' Corner

REMEMBER the little story Virginia wrote for you last year about Tommy's toad? Well, here is another story she has written. Write and let me know how you like it and perhaps this author will tell us another adventure of this small boy.

Address your letter to Little Folks' Corner, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

"Roses and Sugar Cookies"

By EDITH VIRGINIA KIRKWOOD

"TOMMY, did you fall asleep watching old Mr. Toad?" Tommy sat up and rubbed his eyes. Sure enough, he had been lying flat on his stomach dreaming of a queer old toad. Over there was his little red wagon right where he had left it, but the old black pussy cat to which he had been trying to fasten it was nowhere to be seen.

"Tommy, will you take some of these pretty red roses over to Grandma's? They'll cheer her up a bit."

"All right. Can I take my wagon?" The little five-year-old boy jumped up and in a few minutes was off, trudging down the street with his small wagon filled with gifts for Grandma.

Tommy liked to go and visit Grandma for she lived alone in a little old house a short distance away and always kept good things for little boys.

"Hope she has some sugar cookies like she had the last time," he said to himself, looking back every now and then to see if the flowers were still safe. Just then a big dog came running up the street toward him. Now, Tommy liked little dogs and wasn't a bit afraid of them, but this—this was a great big dog. It stopped and started to inspect the little red wagon. Tommy pulled back a little.

"Gee! Go on, ya can't snarl them flowers. They're Grandma's."

The old dog looked up a bit surprised and then, walking around the wagon, he began sniffing at the fragrant little flowers' feet. At his pockets and finally stuck his old nose right up on Tommy's neck.

"Gee! Go 'way!" the child stammered, drawing farther back and stalling his foot in an effort to chase this huge creature away. But Tommy stamped too hard and lost his balance. Backwards he fell right into the gutter, tumbling the little wagon and all the roses on top of

him. Now, there wasn't enough water in the ditch to drown the little chap, but there was enough to make him wet and dirty and to spoil all the pretty flowers.

"That m-m-mean old d-dog," he sobbed, scrambling to his feet and smearing his dirty little hands across his face, wiping away the tears.

"Poor G-gran'ma won't have no n-nice f-flowers now," Tommy continued as he picked up his wagon and a few stragglers wet roses.

"Oh, yes, she will, honey. Here's a real pretty one that must've saved itself for me." And looking up Tommy saw Grandma herself picking up one of the pretty roses from the sidewalk. She had seen him from her front porch and came to help.

"Oh, thank you, Gran'ma," Tommy said, his dirty little tear-stained face brightening into a smile, as he reached for the big sugar cookie that Grandma took from her apron pocket.

TREES

LOMEHCK
PALPE
AKO
RUSPEC
PELAM
RACED

By Christine Winnies, Pennsylvania

NO wonder the young lady looks disgusted! This spelling is terrible. See if you can change the letters to spell the names of well-known trees.

Then when you have written these names carefully on a sheet of paper, suppose you also write a short story on "What I Would Do If I Had \$500." Send it to Little Folks' Corner, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa., and perhaps receive one of the ten prizes offered.

PASSING EVENTS IN PICTURES

1. Easthampton, L. I.—A view of "Home, Sweet Home," the house which inspired the American author, John Howard Payne (1792-1852) to write the immortal song "Home, Sweet Home," as it appears today. There is an old windmill still standing on the grounds.

2. An attractive view of the main street of historic old Winchester, in the famous Shenandoah Valley, as Virginia's fairest daughters marched through its streets in the gay parade which opened the annual Apple Blossom festival.

3. The official Pilgrimage Badge for Gold Star mothers and widows, as authorized by the War Department, which will be issued by the Quartermaster Corps, U. S. Army.

4. A storm at sea.—Coast guard cutter runs into dirty weather on ice patrol in northern Atlantic. Photo shows a heavy sea as seen from the deck of the U. S. C. G. cutter Mojave, which is on ice patrol duty in the Northern Atlantic.

5. Los Angeles, California.—Johnny Riley,

national ten-foot diving champion, on his way through the air to score a perfect bullseye in the novel sport of "target diving" introduced here by the stars who are preparing for the annual spring swimming meet.

6. Dr. Ella Kyes Dearborn of Portland, Ore., with her wonderful collection of 2,157 spoons gathered from every country in the world. The largest, which she is holding, is 23 inches long, and the smallest, which were made by a Chinaman, must be viewed through a powerful magnifying glass.

CONTROL BACTERIA...IN MILK

85% of the bacteria that gets into milk at the farm comes from contact with non-sterile utensils and containers. Much well water used to rinse utensils is contaminated with bacteria. Eliminate bacteria with the B-K plan of sterilization.

1 Milking machine parts should first be rinsed with clear, cold water, followed by hot water—then soaked in a B-K dilution.

2 To prevent contamination and make easy cleaning, run a B-K dilution through separator just before using.

Use B-K according to direction charts in every package. They comply with Federal Law. Send for Bulletin 124 on Dairy Sterilization.

3 Cans, buckets, strainers, coolers, fillers and bottles should be rinsed with a B-K dilution just before using.

GENERAL LABORATORIES, Inc., 515 Dickinson St., Madison, Wis.

20th Co-operative Consignment Sale of REGISTERED HOLSTEIN CATTLE

(Selected from the Choice Herds of Bradford, Tioga and Sullivan counties, Pa.)
Thursday, May 22nd Troy, Pa. Sale Pavilion
(Sale Starts Promptly at 12 O'clock.)

40 Cows Fresh or near Springers 12 Yearlings and Calves 11 Bulls
All but a few head are fully accredited. All are Tuberculin tested and sold with a 60-day retest privilege.
19 Head from herds negative to blood test for abortion.
A number of the entries have C.T.A. records or are from dams with C.T.A. records ranging up to 18,749 lbs. milk and 974.5 lbs. butter.
A considerable number are sired by 1,000-lb. sires, and many of the females are bred to 1,000-lb. bulls.
Several of the bulls consigned are exceptionally well bred, of service age, and from dams with high production records.

PRIEST

REINFORCED CONCRETE STAVE

SILO

SEND FOR FREE FOLDER

Liberal Discounts—for early orders, for early erection, and for cash.

PRIEST CONCRETE CORP., 201 MERCER BLDG., SYRACUSE, N. Y.

Cheap as Wood! Durable as Concrete

The Priest Silo embodies these features:—
Lowest Prices—Modern methods of manufacture and distribution make the delivered, erected price no more than the final cost of a wood stave silo.
Permanence—Reinforced concrete staves with steel frames for doors and roof—all backed by a written ten-year guarantee.
Improved Construction Features—Matched staves with complete tongue-and-groove on sides, top and bottom; an improved method of distributing pressure between stave and hoop; and other inventions of George E. Priest, the dean of concrete silo builders.
Quick Erection—2½ days puts up an ordinary sized silo, by a crew of four trained, efficient workers.

SEND FOR FREE FOLDER

LETO'S FAVORITE BETTY OF HILL TOP, a West Virginia-bred Ayrshire, broke the senior four-year-old record in her breed with a production of 16,669 pounds of milk and 676.67 pounds of butterfat in 306 days. She gave birth to a heifer calf just 369 days after her previous calving. This cow, a senior four-year-old Ayrshire, was bred at Hill Top Farm, Wheeling. The herd at this farm was later presented to Keyman Memorial Farm in Hardy county, at which experiments are conducted by the University and the U. S. Department of Agriculture. Six weeks ago, her record practically completed, the Ayrshire was sold to Percival Roberts, Jr., of Narberth, Pa., owner of the Penshurst herd.

Farm and Dairy

By L. W. LIGHTY

A FEW hundred years ago a careful observer wrote, "Tillage is manure." But long before that and ever since the good and successful farmer knew and has known that maximum crops season after season are grown by tilling the soil thoroughly and completely.

George Clark of the cutaway harrow fame very conclusively proved that the old Jethro Tull adage "tillage is manure" was true.

I have used tillage implements, hand power, horse power and gas power, for half a century, and I am very sure we cannot do too much tilling for crop increase if we do it intelligently, but we do more than is profitable.

To draw the line between profitable and unprofitable tillage is not an easy matter. In a season when weather and moisture conditions are all favorable comparatively little tillage will suffice, but unfortunately we cannot foresee the weather conditions and therefore considerable tillage is often a good insurance against unfavorable weather. The man who plants and sows in a rough and unprepared seed-bed is taking a much greater risk

than the one who carries no insurance against fire or storm, because unfavorable weather conditions are much more common than destruction by fire or storm.

With our modern tillage implements a dollar's worth of tillage to the acre may make a 20 per cent difference in the crop yield, but again it may make much difference. My experience and observation assure me it pays exceedingly well to prepare the seed-bed thoroughly for every crop we plant. This is doubly true with the crops we inter-till as the corn or potatoes.

Cultivator Equipment

In my early days of farming I had endless trouble to secure the cultivator or teeth or shovels I desired to use for different tillages. Today the desired shovels are easy to get.

For the first cultivation when the plants are small the cultivator teeth should be narrow, slim and long, we may loosen up the soil for the air to penetrate and warm up a degree for best growth. A narrow tooth enables us to work close to the plant, which is of course desirable for weed destruction and several other reasons.

After one or two of these deep cultivations the roots will penetrate readily into the space between the rows and those roots should be disturbed as little as possible in later cultivation. Instead of the sharp pointed teeth it is advisable to use blunt pointed shovels with floating wheels so as to disturb the soil only as much as at very most two and yet completely destroy all the weeds and a loose covering of soil over the tire area. I found in a slaty or gravelly soil these blunt shovels should be narrower than in a soil free from small flat stones. But if we have right shovels in good order we can do a very satisfactory job in most kinds of soil.

Since I relinquished the large and confine myself to the flower and vegetable garden, using of course hand power tools, I found I had purchased two hand cultivators before I could adapt them to my method of cultivation, but I am the more thoroughly convinced it is correct, using them a number of years, and later the blunt pointed floating wings are used to the depth of more than an inch, while the hoe is very little. These principles from the hand power wheel hoe to two-row cultivator.

UNADILLA SILOS are Strong

...they are made of sound, close-joined, tight-jointed and seasoned wood. They are anchored firmly to the ground. They are so constructed that they weather-high-winds.

C. T. A. Reports

BUCKS COUNTY

Group No. 1

THE Bucks County Cow-Testing Association finished its second year, March 1, 1930, with twenty-one whole-year and two part-year members. The total number of cows for all or part of the year was 550.

During the year 147 unprofitable cows were sold, and most of them were replaced by pure-breeds.

The results for the two years' testing are as follows:

| Year | Av. No. Cows | Lbs. Milk | Lbs. Fat |
|------|--------------|-----------|----------|
| 1929 | 363.18 | 8144 | 320.4 |
| 1930 | 408.74 | 8395 | 327.1 |

Fifteen herds with an average of five or more cows exceeded an average production of 300 lbs. of butterfat. A complete list of these herds follows:

| Owner | Breed | Lbs. Milk | Lbs. Fat |
|---------------------|------------------|-----------|----------|
| J. P. Canby & Son | R.H. | 11976 | 402.8 |
| C. R. Powell | R.H. | 11412 | 409.9 |
| L. P. Satterthwaite | R.G.H. | 11176 | 376.9 |
| Joseph Briggs | R.G.G. | 8312 | 369.2 |
| R. E. Atkinson | R.J. | 7075 | 359.9 |
| J. W. Halliwell | R.G.H. & G.G. | 10014 | 355.0 |
| E. B. Morris | R.G. | 6945 | 345.1 |
| Willard W. Wright | R.G. & H. | 10065 | 338.0 |
| M. C. Satterthwaite | R.G. & H. | 9765 | 338.2 |
| Charles A. Rowe | R.H. | 9983 | 328.9 |
| A. Satterthwaite | R.H. | 9739 | 313.4 |
| Franklin Briggs | R.H. | 9368 | 311.1 |

BUCKS COUNTY

Group No. 2

THIS Bucks County Association finished its seventh year, March 1, 1930, with twenty-one whole-year and four part-year members. The total number of cows for all or part of the year was 456.

The result for the seven years' testing is as follows:

| Year | Av. No. Cows | Lbs. Milk | Lbs. Fat |
|------|--------------|-----------|----------|
| 1924 | 247.46 | 7724 | 294.3 |
| 1925 | 390.68 | 7549 | 271.3 |
| 1926 | 406.35 | 7552 | 281.1 |
| 1927 | 366.07 | 7686 | 311.5 |
| 1928 | 358.56 | 7879 | 313.8 |
| 1929 | 363.18 | 8214 | 331.8 |
| 1930 | 291.74 | 8161 | 310.0 |

Fourteen herds with an average of five or more cows exceeded an average production of 300 lbs. of butterfat. A complete list of these herds follows:

| Owner | Breed | Lbs. Milk | Lbs. Fat |
|------------------|------------------|-----------|----------|
| M. C. Permar | R.G. & H. | 12168 | 419.2 |
| W. Hunsberger | R.G. & H. | 11982 | 414.6 |
| Clayd Myers | R.G. & G. & L. | 8584 | 396.3 |
| P. W. Smith | R.G. & G. | 7436 | 364.4 |
| Nicholas Guetter | R.H. | 9973 | 348.9 |
| Isaac Gross | R.H. | 7509 | 343.7 |
| W. D. Yoder | Mixed | 8890 | 324.3 |
| George S. Haynes | R.G. | 6430 | 322.5 |
| J. S. Stover | R.G. & H. | 8390 | 311.8 |
| W. A. Twining | R.H. | 8989 | 310.1 |
| C. L. Wilkinson | R.G. & H. | 9515 | 302.8 |
| H. A. Bishop | R.G. & H. | 8837 | 301.1 |
| F. W. Oehle | R.G. & H. | 8387 | 291.5 |
| Nervin Weiler | W. F. Greenawald | | |

Columbia County

THE Columbia County Cow-Testing Association finished its first year, April 1, 1930, with 22 whole-year members. There were 383 cows in the Association during all or part of the year.

Below is given the average production per cow for the five high and the five low herds in butterfat production:

| | Lbs. Milk | Lbs. Fat | Above |
|---------------------|-----------|----------|----------|
| The five high herds | 9098 | 379.4 | \$161.71 |
| The five low herds | 5933 | 211.9 | \$0.37 |
| Difference | 4063 | 166.5 | \$161.34 |

Eleven herds with an average of five or more cows had an average production of over 300 pounds of butterfat.

| Owner | Breed | Lbs. Milk | Lbs. Fat |
|-----------------|------------------|-----------|----------|
| H. B. Role | R.H. | 12222 | 407.0 |
| J. H. Long | R.G. & H. | 10890 | 391.7 |
| W. J. Fairchild | R.G. & J. & R.H. | 9061 | 383.5 |
| R. R. Zimmerman | R.G. | 7180 | 367.9 |
| Frank Hayman | R.G. | 6214 | 313.1 |
| State Hospital | R.G. & H. | 9477 | 336.9 |
| Fred Hillier | R.H. | 9148 | 329.8 |
| Carl Stevens | R.G. | 6906 | 329.2 |
| Roland Seely | R.G. | 6719 | 322.7 |
| Harry Andrews | R.G. | 6213 | 314.9 |
| William Yapple | R.G. & G. | 6507 | 311.2 |
| Harry Lindemuth | P. G. Niesley | | |

Ball bearings protected against rust and corrosion as well as 6 other important improvements

on the

New Golden Series DIE LAVAL CREAM SEPARATORS

Ball bearings throughout, protected against rust and corrosion, are only one of seven new features which make these new De Laval the world's finest separators. You never took hold of a separator that turned so easily—try one and satisfy yourself. And when it comes to clean skimming, convenience of operation, beauty of design and finish, and durability, nothing can approach these new "3,000,000" Golden Series De Laval.

Other new features are trailing discharge bowl, "V" shaped channels on spouts to guide streams straight, self-aligning worm wheel and spindle, improved oil overflow, extended shaft for attaching motor or power drive, and two-length crank on the larger sizes.

These new De Laval must be seen to be appreciated. Your De Laval dealer will gladly let you try one. Trade in your old separator as part payment on one of these new machines and you will be set for life on cream separators.

The De Laval Separator Company
New York 165 Broadway Chicago 600 Jackson Blvd. San Francisco 61 Beale Street

LEADCLAD ROOFS

The Big Issue

When you put on a roof, whether it be on the house or one of the farm buildings, the big issue is "how long will it last?" If the roof is of ordinary metal, you anxiously await the first sign of rust, and it won't be long in coming. Then the cost of painting every year or two.

For more than twenty years Leadclad roofs have been giving rustproof, fireproof, carefree service on thousands of homes and buildings throughout the nation. Being rustproof, they need no paint, and once applied the roof is off the mind for generations.

The difference is in the coating. Leadclad is copper bearing steel with a thick heavy jacket of Pure Lead...and you know lead can't rust.

Ask your dealer today or write us for a free booklet giving complete information on Leadclad.

Farmer's Business Letter

ANOTHER week of warm weather, with occasional showers, has speeded up corn planting, and it is estimated that nearly two-thirds of the acreage in this early in May. In the more northern parts farmers are holding off till a little later, though the ground is practically all plowed and fitted. In general, it is called the most nearly ideal spring for farm work within memory.

However, economic conditions on farms are bad, as they are in cities. Bank failures continue, business is at low ebb, and farm prices are low with the apparent trend lower. In some places there are many farm foreclosures. People now seem to be looking forward to a hard summer. The only bright spot at the moment is the opening up of employment on public works. Farmers are being appealed to by men out of work, but they are in the market for labor in only a limited way.

Hog Trade

The hog market showed weakness the first half of this week, but picked up later with the average price of the week just a little higher than last week—\$10.10 against \$9.95. Runs were heavier early in the week than later. Eleven markets had just about as many hogs as a week ago. The hog market continues in a rather sensitive condition, which is more or less typical of all markets at this time. It is easily overloaded, and as quick to decline on liberal runs as it is to advance on short runs. Prices are running a little over a dollar below a year ago, but are a little higher than a year ago.

Both fresh and cured pork are moving into consumption at a fairly satisfactory rate, at the present level of prices. Export trade is called fairly good. While storage stocks are well under a year ago, packers are reluctant to accumulate pork because they do not have confidence in the future market.

Trading in the futures market was very light this week, with the trend a little lower than last week. Light hogs for September delivery sold at \$10.15; 10.25; medium hogs for September delivery at \$10.10; heavy hogs at \$10.00; and at \$10.10 for September delivery. Buyers and sellers were far apart in their ideas, with buyers having the upper hand.

Lambs Higher

The lamb market opened strong this week and closed at a decline, just the opposite from last week when prices worked steadily higher. The situation, however, is much better than a few weeks ago. At the close prices were about 25 cents above a week ago, with all kinds of sheep scarce and selling at prices called steady.

Top lambs this week brought \$11.50 against a top of \$11.10 last week. Receipts this week at leading points were smaller than last week but still well above the same week of recent years. Lamb is moving into consumption in good shape. Eastern demand for lambs for slaughter being strong.

A review of the lamb situation says that so far as new-crop lambs are concerned, the prospects are still none too encouraging. Unless a near-miracle takes place there will be plenty of lambs to come after the first of June.

Cattle Lower

Following a steady opening cattle trade weakened off this week, and closed with steer prices 25 to 50 cents lower, and other kinds fully 50 cents lower. Steer average at \$11.40 was only a nickel lower, but lowest since June, 1927. Receipts here at 43,000 were 4,000 under a week ago, but some larger than the same week a year ago. Top heavy steers this week brought \$14.75, and yearlings \$13.65. The bulk of sales were at a range of \$10.15 to \$12.65, against \$12.55 to \$14.35 a year ago and \$12.15 to \$14.15 two years ago.

Beef continues to sell slowly on a week to lower market, since it is higher than most competing foods. At the present time there is a lot of discouragement regarding the summer market, with most people in the trade predicting lower prices. This feeling is based on the business situation. This feeling is also reflected in the lack of demand for feeders, though grass is good with promise of an abundant crop. With a decent kind of cattle costing \$11 or better to lay down at home few are disposed to take a chance on their purchase.

Weakness in Grains

Grain markets fluctuated within narrow limits this week, with the trend

lower. In corn, a new low price for the crop season was touched, with both the May and July options selling at a fraction over 77 cents. Foreign advices are that the producers of this continent can expect only a limited export demand for wheat, even during the coming crop year, unless our season's yield should be materially reduced through drought. At the present time conditions are good throughout our wheat growing sections.

A report shows a great increase in wheat production of the Texas Panhandle, an area made up of 26 counties. The wheat acreage in this section is estimated at from 2,000,000 to 2,500,000, as compared to 1,163 acres in the 26 counties as recorded in the 1925 United States census report. The 1929 estimated production was 40,000,000 to 45,000,000 bushels, which may go as high as 55,000,000 bushels in 1930.

A winter wheat crop of 525,070,000 bushels this season, compared with 578,336,000 in 1929, was forecast in the crop report just issued. Condition was put at 76.7 per cent, compared with 83.6 per cent last year. Area remaining for harvest was put at 38,676,000 acres.

The rye crop was estimated at 46,831,000 bushels, compared with 40,629,000 bushels a year ago.

Condition of other crops was given as follows: Oats, 62.3 per cent; potatoes, 74.2 per cent; peaches, 44.5 per cent.

Chicago, May 10, 1930. Watson

The soil, Pennsylvania's endless natural resource, is ministered by the farms which call for electricity.

A NEW RURAL PENNSYLVANIA CALLS US...

PENNSYLVANIA is a leader in mining, manufacturing and commerce. Basic even to these is her agriculture, in which she stands in the front rank with 200,000 farms on which are a population of over 900,000 producing an income of over \$1,000,000 per day. She is also great in forestry and recreational opportunity, with about one-third of her area covered with beautiful mountains offering healthful recreation for her people and inviting tourists by the millions. These two basic industries, agriculture and forestry, with their related recreational value, are calling for electric service.

It is our desire and responsibility to make electricity the servant of all the people... We have pledged the faith of the electrical industry to help create this new rural Pennsylvania. We have been co-operating with the leaders

of the farm organizations for over three years in an effort to better adapt our methods and service to rural conditions. We have already built 9,610 miles of rural line, serving 129,647 rural customers... of which 31,353 are farmers.

The day of the lamp and hand power is past... it is being replaced by modern electric light and motor power. No community can prosper and grow without hard surface roads, good schools, churches and electric service, since these are necessary for economical production and satisfactory living.

Schools and roads are provided through heavy local taxes and state subsidies. We are taking electric service to rural districts at our own expense without adding to the tax burden of the rural people and are furnishing electric current at the same rate per kilowatt-hour in the country that is

charged in town. We ask only that rural customers agree to make a general use of the current. Through the economy of large generating units and inter-connection of electric systems, coupled with advanced engineering practice, we are able to furnish current at rates which make it economical to use electricity for over 200 operations about the farm and home for light, heat and power.

In order to inform the rural people of Pennsylvania what electricity is actually doing in thousands of rural homes and on the farms of Pennsylvania, we are running a series of advertisements, of which this is the first.

Ask the person who has electric service, and he will tell you that in terms of fuel saved, drudgery ended, efficient production, and more satisfactory living conditions...

Grower Insures 100-Acre Potato Crop with Pyrox

USED Pyrox on my 100 acres of potatoes this season and dug approximately 150 bbls. per acre, entirely free from rot, and suitable for fine seed," writes Mr. Frank L. Longstaff of Island Falls, Me., under date of December 10, 1929. He says: "Experience has proved to me that proper spraying is potato insurance through the entire growing season. I find that Pyrox mixes more easily than home-made bordeaux, stays in suspension for many hours after mixing, spreads readily, and sticks to the plant most satisfactorily."

Other growers report equally satisfying results with Pyrox. Pyrox is a combined insecticide and fungicide, scientifically prepared to kill bugs, control blights and other diseases, and to stimulate plant growth. Safe, quick,

easy to use. Does not clog nozzles. Economical because it goes far, gives complete protection. Packed in sizes to suit every need. Now priced lowest in 31 years. See your dealer now, or write us for the free Pyrox Spray Guide. Learn how Pyrox can help you get bigger yields and more profit from all crops.

"The crows went over and pulled my neighbor's corn"

Writes J. E. Meyers, of West Salem, Ohio: From the day he started using Stanley's Crow Repellent, his crow, gopher, mole and other corn field pest troubles were over. But be sure you specify Stanley's Crow Repellent. "It is the only kind I have used with complete success," writes S. Shepherd, West Townsend, Mass. Non poisonous. Will not clog

seed planter. Safe. Sure. A 20 year's successful record. Large can, enough for 2 bu. of seed-corn (8 to 10 acres) \$1.50. Half size can \$1.00. If your hardware, drug, or seed store doesn't have it in stock order direct. "Money Back" guarantee. Address: The Cedar Hill Formulae Co., Box 500R, New Britain, Conn.

Farm Facts and Fancies

By ALVA AGEE

L. H. GODDARD, "Farmer," claims right to membership in the association of owners of "homely farms." After serving the Ohio Experiment Station so usefully for many years he went to the U. S. Department of Agriculture, but now finds solid satisfaction in managing and doing much of the work on a 360-acre place that he likes to call "Antique Farm." The size of this farm, in a section of Ohio where corn is the leading crop, caused me at first to think that the owner didn't belong, but really the size and value of a farm has nothing to do with the matter.

Sticks to Horses

Mr. Goddard has no tractor on this large farm. Although two hundred acres are planted to crops each year, he uses only horses. He says that they do not consume a great deal of merchantable feed, and that they "seem to enjoy living along with us." The profitable use of a tractor demands a well-drained farm, and while this farm is as well drained as the average of its section a heavy investment of cash would be required to drain it thoroughly.

The Cropping Scheme

Our friend says: "Limestone and sweet clover are the mainstays for improving the soil. We sow about one hundred acres of sweet clover a year, with oats as a nurse crop, but we do not cut the latter except what we need for hay. Makes fine pasture. We plow about the same amount of ground per year, or a little more, and sow enough of it to soy beans to balance up the corn that grows on the other part."

The owner, with one man, does nearly all the work on this farm except in case of husking corn, cutting fodder and harvesting of soys, when extra labor is employed.

Admitted on Probation.

Mr. Goddard, whom I should class as a farming expert, brags a bit about his old fences and cheap car, but he admits that the tenant house which he converted into a residence for himself is now equipped with heat, light, power, plumbing, etc., but he incurred this expense for comfort and not for show, and it belongs to the credit side of his claim.

Doubtless the old fences are good enough to keep other people's livestock out of his corn-fields and, as is much more important, to keep his own stock out of neighbors' fields. There may be undue pride in the cheap car, and more hard labor is done than some charter members would approve.

Life's Satisfaction

I am quoting from a personal letter but the lesson taught may justify it. The most interesting point is that hustling efficiency experts, with plenty of capital invested in corporation farming, can hardly drive a level-headed man out of competition in farming. Nearly one-third of the farm going into sweet clover every year insures soil fertility, and the seeding on stalk ground isn't expensive. Where five-sixths of another third of the farm grows corn, and there is additional acreage of soy beans, to balance up the corn for feeding, and there is only a small charge for labor except of one man by the year, and if livestock harvests much of the sweet clover, the risks are small and the certainties are substantial. The owners of homely farms will be sticking around in this country for a long time, and if they are living as they wish to live they have most people beaten to a frazzle.

Fertilizing Potatoes Heavily

It is a long time since Ohio's noted farmer, Mr. T. E. Terry, grew pota-

toes so successfully and profitably without the use of any commercial fertilizer. He saved manure carefully and grew clover. Conditions have changed in many ways, and the best money today is being made by those who fertilize very heavily.

Some growers stick to the old ways and do not get what they should out of the crop. We may skimp on fertilization of staple crops and get by in a fashion, but the potato pays for all the soluble plant food it wants more surely than it pays for half enough. It has a short season of growth, and it gets the greater part of its food out of the row in which it grows, if we may judge by the effect of row fertilization. It cannot wait for plant food.

Successful potato growers, taken as a group, are as up-to-date as any specialists in farming in this country. They put a lot of money into seed, machinery and fertilizers, and must match the investment with that of skill.

Soil Moisture

We know that partial crop failure often follows planting ground after a heavy growth of rye has been turned under. The claim now is that the failure is due to lack of available nitrogen, the store in the soil being exhausted in the process of decay of the mass of green rye. Summer fallowing is condemned on the ground that it causes loss of organic nitrogen.

Granting all that we should on these scores, one wonders why so little emphasis in recent years is placed on the soil moisture supply and its control. We are getting new knowledge about soil processes, but the old truth remains that a satisfactory amount of moisture during the growing period of a plant comes nearer being a controlling factor than any other one thing. A poor soil in a "seasonable" year does surprisingly well.

The Summer Fallow

I like once a year to say something in favor of the old-time summer fallow. It is in bad repute in modern days and needs a friend. I have in mind the owners of poor fields that are growing chiefly some wild stuff which is not worth while. When such land is broken in late May or early June, and is left rough, weeds are killed. A second plowing early in August brings the top soil back to the surface where it belongs. The ground is put into condition to hold moisture and all this time some plant food has been coming available.

Usually such land needs lime. If September is not exceptionally dry we come to seeding time with a good moisture supply and that is half the battle in starting a grass sod in small grain. A complete fertilizer is required, but the summer fallow has paved the way for the sod that the field needs. It is a good way of bringing poor, unproductive, semi-abandoned land back into the road to productivity, and partly because it helps to a supply of moisture when most needed.

Carrots for Horses

Please tell me through your paper if carrots are good for horses. If so, how do you feed them? M. N. E. Barbour county, W. Va.

CARROTS make an excellent feed for horses and are especially helpful when it is necessary to carry horses along in high condition. They should not be fed in large amounts to hard worked horses; twelve to fifteen pounds per day is a liberal allowance. Carrots may be fed either whole or sliced, care being taken if they are sliced not to get a slice too large to be swallowed or too small to be chewed. F. L. Bentley.

Orchard Windfalls

By S. W. FLETCHER

THE proceedings of the seventy-first annual meeting of the State Horticultural Association of Pennsylvania now are being distributed by Secretary R. H. Sudds of State College. This is a volume of 260 pages, which reports the addresses and discussions of an unusually interesting meeting. Some of the subjects considered are: bee keeping and fruit growing; common and cold storage for fruit; apple grading and packing; various spraying problems; thinning; the best varieties to plant. Send the \$2.00 membership fee to the Secretary, or join your County Horticultural Society.

In Paradise

"The fruit grower was spraying. It was a lovely, sunny day, with only enough air to drift the spray cloud away from the outfit. The ground was clear of weeds, rocks and prunings and firm enough not to mire the wheels. The limbs of the trees did not scrape off oil cups or bend the levers as he passed along, and the foliage and fruit were at just the correct stage for the application. The engine had started at the first turn of the crank and was purring smoothly, enabling the well-oiled pumps to keep the pressure bumping against the maximum. His spray tank did not leak or plug nor was there any slop from around the lid. His hose seemed to move about easily and gracefully without kinking or catching on obstructions, and his spray gun delivered a beautiful cloud of steam-like quality without dripping or sputtering or clogging. None of the spray was blown back into his eyes. In fact, everything was perfect and he sang blithely as he worked.

"Well might he bubble over with joy; the truth is, he had died and was now in heaven." (From the Bulletin of The Crop Protection Institute.)

Apple Grades

The fruit growers of the eastern states, as represented at the recent conference in Washington, very wisely decided not to urge the United States Department of Agriculture to make radical changes in the present United States Standard Grade for apples. These grades have proved quite satisfactory as they are. A few minor modifications may be desirable, but the evidence is quite convincing that the major requirements are fair, and that they are working out for the interest of the fruit industry. The fact that a steadily increasing number of carlot shipments of Pennsylvania apples have Federal-State inspection shows how the growers feel about it. But some way should be found to avoid the damning term, "No. 2," and to secure uniform grade designations for the entire country.

Horticultural Show

The Farm Products Show Management will feature the horticultural exhibit in the new building next winter. An effort will be made to secure a large competitive display of greenhouse flowers and ornamentals, including ornamental nursery stock, and to use these to embellish the fruit and vegetable exhibits, as is done in the annual Horticultural Show at State College, in October. S. W. Fletcher has been appointed Director of Horticulture, and will seek to coordinate the fruit, vegetable and ornamental exhibits into an attractive whole. Each of these departments will have a superintendent, as heretofore. Since the meetings of the State Horticultural Association will be held in the same building, it will be possible to use the exhibit material more freely for demonstrations than formerly. It is expected that the fruit exhibit will be stimulated by the recent action of the Farm Products Show Management in approving the recommendation of the State Horticultural Association that all exhibits remain the property of the exhibitor.

THREE FARMS that are real BARGAINS...

PENNSYLVANIA Washington County

Arnold L. Hopp Farm, No. 2495—200 acres.—Located in very good community, 3 miles northeast from West Alexander, railroad and trolley at West Alexander, 2 miles from railroad station Vienna (Goon Island), bus transportation over National Highway from either West Alexander or Vienna, makes easy transportation near. Country school only few rods distant and 3 miles to high school. Available markets at Washington, Pa., market distance from Wheeling, West Virginia, which is 16 miles from West Alexander on National Highway. Suburban Wheeling, extends to within few miles of farm. Contains 40 acres in pasture, 110 acres suitable for cultivation, 50 acres uncultivated. Buildings consist of 4-room dwelling, tenant house, barn and other buildings. The soil is clay, shale, stony loam and adapted to dairy or general stock farming. Sale Price \$30,000. Cash \$1,200.

PENNSYLVANIA Erie County

Fred E. Trimm Farm, No. 10538—85 acres.—Located on public road 2 miles from concrete road; 3 miles north of Keepville and about 5 miles west of Albion, the nearest city. 3 miles to nearest railroad and shipping point, 1/2 mile to nearest school and 2 miles to nearest church. Contains 56 acres tillable land, 20 acres in pasture and 10 acres in woodland. The buildings consist of main dwelling, main barn and other outbuildings. Adapted to the growing of corn, potatoes, oats, hay, etc. The soil is clay loam and of good fertility, watered by wells. Sale Price \$2,000. Cash \$400.

PENNSYLVANIA Lehigh County

John Schwab Farm, No. 13394—85 acres.—Located in good farming section, close to market, 1/4 mile from Leather Corner Post Road, which is of concrete construction; 3 miles to Seagorville, the nearest railroad station; 1/2 mile to the nearest school and 1/2 mile to the nearest church. Contains 85 acres suitable for cultivation, and 10 acres of woodland. The buildings consist of a 2 1/2-story, 11-room frame dwelling in good condition, barn, pig pen, wagon shed and straw shed. Soil gravelly, especially adapted to trucking. The farm is watered by wells and a good spring, and adapted to the growing of corn, wheat, buckwheat, hay, oats, cabbage, tomatoes and especially potatoes. Sale Price \$5,800. Cash \$1,200.

THE FEDERAL LAND BANK OF BALTIMORE

REAL ESTATE DEPARTMENT

BALTIMORE, MARYLAND

Bern Flapper, Imp., noted champion. Several of her progeny in sale.

THE SECOND ANNUAL STRATHGLASS SALE

at the Farm TUESDAY, JUNE 10th

Affords Ayrshire breeders and those interested in founding herds an exceptional opportunity to buy the best, 25 Head of the outstanding young males and females selected from our herd, which now numbers over 300 head, and 25 bulls selected from the best herds in Scotland and imported especially for this event are selling. The Strathglass Sale guarantees, as to health, soundness and breeding adds materially to the value of this opportunity. STRATHGLASS FARM, A. H. Tyron, Mgr., PORT CHESTER, N. Y. (25 miles from New York City.)

All cows and heifers of milking age in the STRATHGLASS AYRSHIRE HERD

8 or more months in the year 1929 averaged 9,551 lbs. milk, 388 lbs. fat, mature equivalent 418 lbs. fat and 4.06% test.

A pamphlet picturing many of these cows and some of their progeny will be sent free to any one who will write for it.

PUBLIC SALE OF AN ENTIRE HERD OF Twenty-Seven Head of HOLSTEIN CATTLE

3 Miles East of Centre Hall, along State Highway Route 45
WEDNESDAY, MAY 22,

Herd consists of 8 Reg. Cows, 16 Reg. Heifers, 2 Reg. Bulls, 2 Reg. Heifers, 2 years old, will be fresh by time of sale; 3 Reg. Heifers, 1 year old; 4 Reg. Heifers, Born since Oct. 1st; 1 Reg. Bull, 8 mos. old; Grade Heifer 1 year old, 2 Grade Heifers, born since August 1st.

These cattle are above the average in type and production. The breeding is along the best and most popular lines. In type we aim to have a straight top line, stand up well on hind feet—an animal good to look at, as a thing of beauty is a joy forever.

HERD FULLY ACCREDITED FOR 7 YEARS. In production these 14 cows produced over 10 tons of milk in March, that was delivered to the local milk station. The daily milk production of any other herd of cows whose milk is delivered to any of the 5 nearest milk stations. The Cow Testing Association records for the month of April show an average daily production of 50.3 lbs. of milk per cow per day. The individual production record is from a 10-callon can of milk per day, down.

SALE STARTS PROMPTLY AT 1:00 P. M. Refreshments will be served on the premises by the Ladies' Aid Society.

I WAS leafing through the large illustrated catalogue of a big manufacturing company today. Every article in it was something for use in a modern home, and was operated by electricity. If such a catalogue had been placed in my hands when I was a boy it would have seemed more marvelous than were the tales I read of Aladdin and his lamp. But I notice my grandchildren look at these pictures and accept them in a matter-of-fact way. The things they represent are in their every-day experience.

As I laid the catalogue aside I fell to reminiscing. I went back in memory to the homes I knew best half a century ago. Not a single thing offered in the attractive book was in grandfather's home or our own home, for the simple reason they were not made, nor even thought of. Today, when you call at any modernly equipped residence you first push a button and an electric bell rings in some part of the house. A member comes to the door, turns a switch and you are admitted into an electrically lighted hallway. In fact every room in the house may be flooded instantly with light. If the evening is very warm an electric fan may be started, or, if the room is too cool, an electric heater is as quickly and easily set in operation. The house is kept clean by an electric cleaner. The clothes are washed by electric power. Toast is made and coffee prepared by electricity, and in many homes the entire meal is cooked by electricity. After returning to the sitting room some one turns on an electric radio and the best things in the world may be had by the simple turn of a dial.

Well, in those earliest homes I knew not a single one of the above pleasures and conveniences existed. How would the present age get along if they suddenly were all wiped out? We would probably spend more time in bed, as our grandfathers did, which might be a good thing for us to do. But the changes inside the home are little if any greater than those about the farm and farm buildings. The only piece of farm machinery on my grandfather's farm in his day was an old-fashioned threshing machine. It was a four-horse sweep affair. The power was furnished by four horses hitched, tandem fashion, to four "arms" centering in a big flat power wheel having cogs around the outside. A driver armed with a long whip stood in the center on this flat wheel and kept the horses to their duty. A two-piece "tumbling shaft," coupled together by a universal joint, conveyed the power to an "under-shot" cylinder placed near the door inside the barn. There was no "shaker" and no cleaning attachment, so the grain and chaff had to be run through a fanning mill afterward. These two machines were the only things in the way of farm machinery grandfather ever owned.

I think it is a good thing for us to measure our progress and our blessings sometimes by glancing back once in a while over the way the race has come, else we take too much for granted. If we were, by some misfortune, to be deprived of all the farm machinery invented and adopted since grandfather's day it would require the work of all the men in the United States from now until Christmas to gather in the coming harvest.

I write this on "Mother's Day," and while writing the above notes on the changes which have been made within my lifetime, I am reminded that one feed and breed.

thing, the most important in any home,—mother love—has not changed. Thank God for that!

Friendly Talks

By
Edgar L.
Vincent

ONCE more experience has proved that a great many times our worries have nothing behind them except a big fear. When the Mediterranean fruit fly first came to one of the states farthest south, we all thought we were going to be eaten up alive by this new and hungry pest. My! What an awful thing that was! We saw our orchards stripped bare and our fruit prospects ruined. We imagined that after the fruit trees were gone the fly would keep right on and not stop until it had devoured all other trees and crops of all kinds. But see what has happened. Not a fly left in the South they tell us; and what is more the northern states never were in a bit of danger from this pest, for it cannot live where the mercury gets lower than 50 degrees. We had all our worries for nothing.

Our Worries Are Ghosts

Now, I do not say that we are never to pay any attention to our forebodings. There is more than a little truth in what a man said to me one time. I met him on a crowded train. We were speaking of this very thing. My seatmate said, "You've got to worry sometimes. You'll never get anywhere on the farm if you don't."

But it seems to me that man did not exactly mean worry when he said that. He meant that we need to use all due forethought and take all possible means to prevent things from going wrong. We are bound to watch the clouds and get our hay in if it looks like rain. We must fight borers and flies when they come. We cannot hope to succeed unless we plan and put the best there is in us into everything.

But that is not necessarily worry. Worry is like the wear that comes to a machine that is not oiled when it ought to be. Faith in one's own self and trust in the Supreme Power are the oil we need to save us from going to destruction.

Treatment of Asparagus

ASPARAGUS is a rather heavy feeder, having a vigorous and far-flung root system. It is best to fertilize in spring. This year's crop will be affected practically not at all since food for that was stored in the roots last fall. But fertilizer applied now stimulates the 1930 top growth and the 1931 crop will benefit.

If stable manure is used, it should be well rotted to avoid the introduction of weed seeds. A commercial fertilizer in which the three figures showing percentages of nitrogen, phosphoric acid and potash are nearly equal may be used. It should be applied at the rate of a pound to every six or eight feet of row.

Asparagus planted in 1923, if it grew well that year and last year, may be cut a while this season, not too long, about three weeks. Cut clean during that time. Older plantings are usually cut seven or eight weeks and they also should be cut clean, stalks not usable being discarded. N. Y. College of Agriculture.

Small Producers' Problems

By GEORGE F. JOHNSON

WHILE specialized producers, here and there throughout the state, are marketing products by the car or truck loads, still we have in Pennsylvania probably 100,000 farmers who market at least some portion of their products at certain periods of the year on a very small scale. It is perhaps no exaggeration to say that these farmers carry annually to market, in their buggies, wagons, small trucks, or automobiles, produce worth \$50,000,000.

Unfortunately this form of marketing is too often inefficient because the products are brought to market in such small quantities and because normally there is no regular supply of any one product for sufficient time to build up a definite trade outlet.

Are modern marketing principles of grading practical under such circumstances? Can such small-scale production and marketing be tied up successfully with the chain stores, for example?—that of the chain stores, for example? A few decades ago "trading in" farm produce for groceries at stores was a universal practice. The system carried through from one generation to another because it was practical even though it did not encourage the production of higher quality products. It was a great convenience and accommodation for busy farmers. It was a dependable outlet. It was a system which readily adapted itself to the seasonal nature of the small producer's supply.

At the present time, the retailing system in Pennsylvania has changed considerably from that prevailing a few generations ago. The most significant change is that brought about by the introduction of chain stores and associations of independent grocers which now operate on a large scale. This reorganization of local retailing raises several interesting questions.

Will such organized retailing become as important in the twentieth century marketing system for local producers in Pennsylvania as the country stores were in the marketing arrangements of the past century? In other words, will the chain stores assume those responsibilities which have been so widely performed in the past by country stores? In all probability the marketing methods of many Pennsylvania farmers will have to be revised considerably before they can properly fit into the present picture of food retailing.

Roadside Markets

The consolidation of management in retail food stores affords unusual marketing opportunities for large scale local producers, but in doing this it also brings producers, particularly the small ones, into greater competition with larger producers in other parts of the nation and world. It brings about a competition in which production of uniform quality available in quantity is the criterion. Obviously, thousands of small producers have been handicapped.

In view of this situation it is not surprising that farmers have grasped other marketing opportunities. Roadside markets, for example, have increased in number greatly during the past decade and are proving practical; they function best during the summer and fall when farmers have produce to sell, if at any time during the year. It is to be regretted, however, that some farmers are making only a half-hearted attempt at roadside marketing, giving little attention to grading and

packaging the produce. Such conditions and practices have disappointed many urban customers who have since gone back to the attractive city stands of California fruit and southern vegetables.

The increase in number of market houses in towns and cities throughout the state, which with the automobile and truck is extending the marketing outlet for farm producers, is a second important development. While market houses have been a part of the marketing system in Pennsylvania since colonial times, present-day popularity of these markets is indicated by the fact that more than \$1,000,000 of private capital have been expended in the construction of new markets during the past few years.

The established markets in Pennsylvania today, numbering more than 130, offer the largest single direct marketing operation in the United States. But here again it must not be assumed that all marketing by farmers through these markets is efficient. Not long ago, the Bureau of Markets of the Pennsylvania Department of Agriculture secured from farmers detailed items of expense in marketing 628 loads of produce in Carlisle, Reading and Erie. This astonishing fact was revealed: More than one-third of these loads were valued at \$30 or less, even in the summer and fall seasons, and the selling expense, not including the cost of hauling to and from the market, was approximately one-fifth of the entire value of the load.

Such conditions prompted Bureau officials to say that the selling costs of small loads is high and if

Convenient price sign and attractive fruit at roadside market, Lancaster county.

is no argument against the farmers' markets, but it should discourage the practice of bringing extremely small loads to retail market houses.

Value of Quantity

The whole situation, whether it be marketing in a farmers' market house, selling to a chain or association of retail stores, resolves itself very largely into one thing: marketing in quantity. This makes possible some standardization of the product. Chain stores are demanding and will continue to demand well-graded, high-quality products in quantity. The whole chain store system is based on these principles and executives will search the land for a quality product that can be bought in quantity. The writer has noticed Maine potatoes and Oregon apples being sold at times in chain stores in the very heart of Pennsylvania producing sections during the local harvesting season.

It is no doubt true that a little more specialization and more cooperation would work wonders in improving marketing methods in Pennsylvania.

Many commercial fruit growers and potato raisers in the Commonwealth now regard the chain stores and associations of retailers as a distinct asset in their marketing program. They have made the proper connections and much to their surprise have found the buyers for these stores easier to deal with than many of the independent retailers.

We have small groups of dairymen cooperating to supply towns and cities with milk. Why not have small cooperative marketing units to supply groups of local chain stores or other outlets with well graded eggs, fruit, potatoes, etc.? These cooperatives might arrange to have stands in market houses, and sell produce the same as individual farmers do now. They might also establish roadside markets at favorable locations along main traveled roads.

Potatoes are being produced for sale in Pennsylvania at the rate of about 100 bushels per farm and eggs at the rate of approximately 400 dozens per farm annually. The cooperation of 30 average farmers would make available for market the production of 3,000 bushels of potatoes which could be readily graded and sold accordingly. In like manner, cooperation of 30 farmers would give a supply of some 12,000 dozens of eggs which again could be marketed on a strictly graded basis and to greater advantage than

APPLE MARKETING

LAST week a committee of fifteen, representing the principal apple growing regions and growers' organizations, met in Washington at the call of the Federal Farm Board to discuss future operations under the Agricultural Marketing Act. No official report of the meeting has appeared so far, but current report is to the effect that the committee was of the opinion that the best thing the Federal Farm Board can do about the marketing of apples is to let it alone.

IN THE DARK

IT is known that the Grain Corporation, the agency of the Federal Farm Board, has a vast amount of wheat. Nobody knows how much it has, for its transactions in buying and selling are not made public. The natural tendency is to exaggerate the amount, and if it is overestimated every holder of wheat is bound to suffer thereby. There is not a single sound reason why a public agency, operating with public funds, should be permitted to work in secret. There is every reason why it should be required to publish its transactions promptly and regularly. A few years ago farmers' organizations were demanding that the light be turned on those who were supposed to be working in the dark. Why not turn it on those who are known to be working in the dark?

A PUBLIC SERVICE

THE Department of Agriculture renders a conspicuous public service when it tells the world that both white and whole wheat breads are wholesome foods. It is high time that science corroborates human experience in regard to bread, meat and some other things. Let us hope that science will find that pie, strawberry shortcake and all the old-fashioned good things are all right when used in proper relation to other parts of the diet. We are again all food fads and faddists. We hope that science and common sense will expose the folly of the fads and the ignorance of the faddists. The best way is to eat in moderation a variety of foods and then forget about it. Nobody can have good digestion if he constantly worries about what he has eaten or is going to eat.

BUSINESS AND CONSUMPTION

A READER wants to know where we get our information about the effect of business and employment on the consumption of farm products. We get it by observation and

PENNSYLVANIA FARMER

by reports from those who handle foodstuffs wholesale and retail. These reports are not in the form of statistics, as there is no system of collecting such information. But they are reliable because they are the actual experience of men in business. There is a very clear relation between consumption and industrial activity. Farmers in mining regions can see it in the demand for their products which are sold at or near home. Those who are more remote from consumers cannot realize it as do those who come in contact with consumers. Unemployment or the fear of it affects first and most the higher priced foods and ultimately all foods, though not all in the same way.

FROM LIFE

A YOUNG farmer who engaged in another business on the side got a terrible jolt. The man whom he trusted to handle the outside business accumulated all the debts and all the cash he could and departed. The young man's first thought was to go into bankruptcy and start again. His second thought was to tell his banker and try to work out with his aid and counsel. The banker went over the whole matter, then sent him to the companies he represented in his outside business. He told the plain truth to all of them. They advised him to go right on and told him they would not press him for their money, as they knew him to be industrious, capable and honest. His character had saved him. He prospered and in due time paid off all his obligations. He has often told us this experience as an example of the fact that character is the real basis of credit.

GUARANTEED WHEAT LOANS

THE provinces of Manitoba, Saskatchewan and Alberta have enacted legislation to guarantee the loans made by the banks to the Canadian Wheat Pool. The Pool borrowed the money for its advances to growers, holding the wheat and giving it as security to the banks. When the price of wheat approached the amount loaned on it the banks demanded protection. The only way for the Pool to pay was to sell the wheat, and the forced sale of so large a quantity would have been disastrous to the price. So the governments of the three great wheat producing provinces were virtually compelled by the situation to guarantee the loans and hope for a market that would allow the wheat to pay them. If the market allows such payment the governments will have lost nothing by their guaranty. If not they must pay whatever difference there is between what the wheat realizes and what the banks have loaned on it. In other words the taxpayers must pay, and in these three provinces most of the taxpayers are wheat growers.

WHY WOOL IS CHEAPER

A READER asks us to tell him why wool is so much cheaper than it was only two or three years ago. A general answer is that the production of wool has been increasing at a time when consumption of it was restricted. In this and several other countries wool clips have increased in recent years. In practically every country other fibres have been substituted because they were cheaper than wool. And such substitutes as cotton, silk and rayon are all cheaper than they were a few years ago, which is favorable to substitution in manufacture and use. Fashion has been unfavorable to free use of wool but it may work the other way in the near future. Important groups of consumers, such as the Russian people, have been unable to buy wool fabrics, at least to buy them freely. The textile industry of the two greatest wool manufacturing countries has been in a bad way for several years. The inability of that industry to operate at a profit has affected the

price of its raw material to some extent, although nobody can say definitely how much any one of the above influences is responsible.

THE PIGEON MYSTERY

IN our issue of April 12 we stated that "genuine wild pigeons" had appeared in large numbers in California, where they were doing much damage to vineyards. Our information was derived from a man just back from California and from articles in the papers of that state. Our statement was promptly and properly challenged, as it indicated clearly that the California pigeons are the passenger pigeons once so numerous in central and eastern states. After some correspondence we now have information which shows that our statement was incorrect. Let us quote from a letter by H. C. Bryant, in charge of education and research in the Division of Fish and Game of the California Department of Natural Resources: "The birds referred to in the newspapers the last few months are band-tailed pigeons, birds which commonly feed on acorns and birds which are limited to the western United States. Band-tailed pigeons were given total protection in 1913, at which time they were found in small numbers, since they had neither season nor bag limit. It has taken them nearly twenty years to appear in sufficient numbers so that there is complaint of damage to agriculture. Please help to refute the mis-statements in magazines which have led people to believe that the passenger pigeon had been refound in California. This is not true. Our western pigeon, however much like the eastern bird, does have a square-ended tail and a black band across the tail which gives it its name." So the fate of the passenger pigeon remains a mystery; but we hope this correction is fair and ample.

TAXATION OF COAL LAND

LARGE areas of farm land in Pennsylvania and West Virginia are underlaid with coal. In some cases the coal has been sold to operating or manufacturing companies, in some cases it remains the property of the land-owner, but in all cases it is taxed. Here arises a problem. There is no regular market for coal acreage. In recent years, since the beginning of depression in the bituminous industry, it has been practically unsalable. Yet taxes must be paid on it every year, sometimes on a high valuation, without the possibility of selling it or getting any return of any kind from it. For the farmer can't sell without buyers, nor can he use something that lies hundreds of feet below the surface of his land. What should be a valuable asset to him threatens to ruin him. He may in fact be taxed into bankruptcy by the mere possession of something which he can neither sell nor utilize.

If the land-owner is not taxed neither can he be taxed the corporations which hold coal for future exploitation or use; and these corporations are now paying taxes on large areas. Any system of deferred taxation, realization taxes to be paid when the coal is sold or used, must apply to corporations as well as to individuals. Such a system would thus leave a current tax burden now shared by the corporations to be borne entirely by the rest of the community.

No solution of this problem is in sight, at least no local solution. Whatever is responsible for the condition of the coal industry in this region is responsible for the serious plight of many farmers who own coal acreage and can neither sell it nor pay taxes on it. The Interstate Commerce Commission cannot escape a part of this responsibility, for it has permitted discrimination in freight rates to lake ports to an extent almost destructive to the northern coal producer and to all owners of coal lands.

AN event of vital interest to farmers is the Farmers' Field Day to be held at the New Jersey College of Agriculture and Experiment Station at New Brunswick, on Wednesday, June 11th.

No farmer can afford to miss this opportunity to visit the Experiment Station and familiarize himself with the research work which pertains to his business and to become acquainted with the men who are conducting this work.

All laboratories will be open to visitors, and the Station staff will be present to explain to visitors the work being done in the laboratories and on the various experimental plots of the College farm.

Bring your various farm problems and questions with you. The extension specialists and research men will be there to help. Don't miss Farmers' Field Day.

RECENTLY I read in a newspaper of a man living near Emporia, Kansas, who while picking burrs from a mule's tail was kicked by the mule and fatally injured. Few farmers show so much confidence in the good humor of a mule, and such carelessness on the part of any farmer as expressed in this case would seem almost incredible, yet every day New Jersey dairymen are exposing themselves to a greater danger by the careless handling of bulls. For years the Dairy Extension Department, newspapers and farm papers have been warning dairymen against careless handling of bulls, and have related many deaths and injuries as a result of this. No owner of a herd sire can afford to take any chances and all such owners should seriously consider construction of a safety bull pen. Any of the county agents will gladly provide plans for such a structure.

"MILLION dollar shower!" Similar captions to this were read in nearly all the New Jersey and Eastern Shore papers after the rains of last Wednesday broke the four-week drought in this section. To estimate the losses caused by the drought and the value of the rainfall last week is almost impossible, but we do know that to many farmers the rain meant the difference between success and total failure. The spell of dry weather during the planting season is the longest which has been experienced for years along the Eastern Shore, and will severely cut the early crop production.

The strawberry crop which a few weeks ago was estimated as a bumper crop will not be more than 50 per cent of normal yield. In New Jersey the lack of rain delayed planting of early tomatoes and retarded germination and growth of all early vegetable crops.

IN order to act on several proposed changes for the supervised class of poultry which is under supervision of the New Jersey Department of Agriculture, all interested poultry breeders are urged to attend the Sixth Annual Certified Breeders' Conference to be held at the State Capitol in Trenton, May 22.

NEW JERSEY farmers are becoming interested in and are supporting the effort to establish definite selling and closing hours for the sale of fresh fruits and vegetables in the Philadelphia markets. Last week the Gloucester County Board of Agriculture adopted the following resolution: "Whereas commission merchants of Philadelphia have passed an agreement to open and close their stores at regular hours to create better business conditions:

"Be it resolved that the Gloucester County Board of Agriculture heartily endorses and advocates such a move and further recommends that our farmer members support by their patronage those commission merchants who will abide by such regulated opening and closing hours."

The Gloucester County Pomona Grange had previously adopted a resolution similar to the above. This week farmer groups in other counties which ship large quantities of fresh fruits and vegetables to Philadelphia will discuss and act upon this move made by commission men to establish definite hours in the market.

New Jersey Farm Comment

By G. W. HARRIS

MARYLAND farm women will gather at College Park from June 16 to 21 for the eighth annual Rural Women's Short Course. Although about the same range of subjects will be covered as in former years, many new speakers of prominence will appear on the program.

Courses will be offered in foods and nutrition, household management, house furnishing, clothing, ornamental gardening, home dairying, poultry, parliamentary law, recreation and music. A new feature will be exhibits of table service, canned products, handicrafts, hooked rugs and farm products.

The programs are divided into class groups, as in previous years, with the addition for an extra program planned for the fifth-year group this year. If all the women eligible return there will be 91 in the fourth-year class to receive certificates, according to Miss V. M. Keller, state home demonstration agent.

THE Second Annual Baltimore Livestock Exhibition will be held at the Union Stock Yards from October 14 to 17. The first show to be held last year was arranged on short notice, but this year early plans are being made for an exhibit even better than their successful show last fall.

Exhibits will be divided into five departments, including fat cattle, boys' baby-beef steers, feeder cattle, fat hogs and fat lambs. In the fat cattle department there will be classes for carload lots, truckload lots and individual steers and heifers. Classes for each of the principal beef breeds are offered in the boys' baby-beef department and the car-load lots of feeder cattle are also divided into

classes on the basis of leading breeds. Fat hogs will be entered in carload lots, pens of five and individual barrows. The sheep department will have three classes, one each for carload lots, pens of not less than ten nor more than 20 and best wether or ewe lamb.

A horse show for pure-bred draft horses and an exhibit of pure-bred beef bulls also is planned. A sale of fat cattle, hogs, lambs and feeder cattle will be held during the latter part of the show.

FARMERS' Marketing Conference will take the place of the usual Farmers' Day at the University of Maryland this summer. This meeting, the first of its kind to be held in the state, will take place at College Park on August 12 to 15. Four days will be spent in a discussion of marketing problems as they relate to the farmer, present market conditions and trends of the markets.

IN the latest issue of "Hints to Potato Growers," the official bulletin of the New Jersey Potato Growers' Association which first appeared ten years ago, Dr. Wm. H. Martin reviews the New Jersey potato industry during that period of time.

He brings out the fact that since 1920 the acreage in potatoes in the state has been reduced from 90,000 acres to about 52,000 in 1930. In Central Jersey ten years ago from 70 to 80 per cent of the acreage was planted with the American Giant variety, a variety of poor quality which brought low prices. At the present time about 90 per cent of the acreage is planted with Irish Cobbler, with about eight per cent Green Mountain and two per cent miscellaneous varieties.

The first tests in the state to compare certified and non-certified seed potatoes were started in 1920. Prior to that time less than five per cent of the seed planted in New Jersey was certified, but in 1930 it is estimated that 95 per cent of the acreage is planted with certified seed.

"Prior to 1920 most of the seed planted in New Jersey came from Maine and New York with a little from Virginia. In 1920, one sack of Prince Edward Island certified seed was planted in the seed source and variety tests in Monmouth county. In 1930, over 75,000 sacks of this seed were planted in the state. In addition seed from Maine, New York, Maryland, Virginia, Vermont and New Jersey is being used for planting."

Doctor Martin shows that the amount of certified seed produced in New Jersey is increasing, that growers are now planting more seed per acre, and that seed disinfection and spraying has become a general practice.

In regard to fertilizer practices he says, "Ten years ago it was the practice to derive a considerable part of the nitrogen from nitrate of soda. When the growers were shown that this increased scab they soon substituted sulphate of ammonia."

"Another development in the use of fertilizer has to do with the introduction of concentrated mixtures. A considerable number of growers are using 10-16-14 rather than 5-8-7 mixture. This is applied at the rate of 1,000 pounds rather than 2,000 pounds per acre and consequently greatly simplifies the planting operation."

STIFFER sentences for convicted chicken thieves are urged in a resolution by the executive committee of the New Jersey State Poultry Association.

The resolution states that poultry thieves, when brought to trial, "often arouse public sentiment and sympathy in their favor so that sentences incommensurate with the extent of their crimes are imposed."

After pointing out that the laws of New Jersey provide adequate punishment for such offenders, the resolution asks "those empowered to dispense justice... to mete out sentences which will discourage poultry thieves and protect an essential food production industry in which many thousands of New Jersey's citizens are engaged."

Activities of poultry thieves, according to members of the poultry association, have caused considerable loss and in some instances even entirely deprived poultrymen of their means of making a living.

It Is Not Too Late for Master Farmer Nominations

Pennsylvania Farmer sponsors the Master Farmer project in order to find and give recognition to men of noteworthy achievement as farmers and rural citizens. Those chosen for the Master Farmer Awards cannot be truly representative of the best in eastern agriculture unless nominated by people in close touch with every rural community. That is why the responsibility of making nominations is left entirely to readers. No publicity and no responsibility is involved; we ask only that you give us the right names. May 31 is the closing date.

As in the last two years, Pennsylvania Farmer and the American Agriculturist are the joint sponsors of the Master Farmer movement in New Jersey. They will cooperate in working with the judges and in honoring the men chosen for the Awards.

THE BOARDS OF JUDGES

The following Boards of Judges will make the final selection of the men to receive the Master Farmer Awards of 1930:

Pennsylvania
R. L. Watts, Dean of the School of Agriculture and Director of the Experiment Station, Pennsylvania State College.
C. G. Jordan, Pennsylvania State Secretary of Agriculture.
John Light, Secretary of the Pennsylvania State Grange.
R. G. Bressler, Deputy Secretary, Pennsylvania Department of Agriculture.

New Jersey
J. G. Lipman, Dean of the New Jersey State College of Agriculture and Director of the Experiment Station.
William B. Duryee, New Jersey State Secretary of Agriculture.
H. E. Taylor, Secretary of the New Jersey Federation of County Boards of Agriculture.

Delaware and Maryland
T. B. Symons, Director of Agricultural Extension, University of Maryland.
C. A. McCue, Dean and Director, Agricultural Experiment Station, University of Delaware.
O. K. Quivey, Agricultural Agent, Baltimore and Ohio Railroad.

West Virginia
John W. Smith, Commissioner of Agriculture, State of West Virginia.
F. D. Fromme, Dean of the School of Agriculture and Director of the Experiment Station, W. Va. University.
Nat T. Frame, Director of Agricultural Extension, W. Va. University.
O. K. Quivey, Agricultural Agent, Baltimore and Ohio Railroad.

Nomination Blank

Master Farmer Editor, Pennsylvania Farmer,
7301 Penn Avenue, Pittsburgh, Penna.

Sir:
I nominate the following as a candidate for one of the Master Farmer Awards of 1930:

Nominee's Name

Address

County State

My Name

Address

On the coming Pacific Northwest Tour we shall leave the land of the Stars and Stripes for a visit to our foreign neighbor to the north. This summer's trip is similar in that respect to last winter's Pennsylvania Farmer Tour when we visited our southern neighbor, balmy Cuba.

This photograph just received was taken by Cuban authorities when some of the 130 members of the Florida-Cuba party visited the splendid exhibits of the well-managed Agricultural Exposition at General Machado, near Havana. The gentleman in white is Mr. Sanchez who was the hospitable host and guide to our party in balmy Cuba. At his right is Mr. Crespo, director of the Exposition. At the extreme left, straw hat in hand, is Mr. Aguilar, another of our Cuban hosts. Mr. Sanchez is head of the plant industry bureau of the Cuban Department of Agriculture—Jefe Sanidad Vegetal, Secretaria de Agricultura, Republica de Cuba.

Questions About the Summer Tour

THE newspapers have been devoting a lot of space to President Hoover's vacation plans for this summer. They say he is going to visit the two great national parks of the Pacific Northwest—Glacier and Yellowstone. What they don't say, but should, is that the members of the Pennsylvania Farmer Pacific Northwest-Glacier-Yellowstone Tour will visit those two great parks just a few days before Mr. Hoover.

As nearly every one knows, the Pennsylvania Farmer Tour this summer not only includes those famous parks with their wild Indians, tame bear, glaciers, geysers, canyons, boiling springs and other natural and unnatural wonders too numerous to mention. It also covers nearly 8,000 miles of comfortable travel in Pullman, automobile and steamship across the plains, the mountains and broad waterways of the northern United States and southern Canada.

It pays a visit to Niagara Falls, Chicago and the Great Pacific Coast cities of Seattle, Longview, Portland, not to mention Spokane and the famed apple valley of Wenatchee whence 20,000 carloads of apples a year roll forth to the world's markets. It calls on our Canadian cousins up in Vancouver and Victoria. It goes to see if Wyoming is still wild and woolly. It pauses in Denver, the metropolis of the Rockies, before going on to Colorado Springs to see if the mountain scenery reveals why the pioneer threatened to "bust" rather than miss Pike's Peak.

But all that, and much more, is set forth in the tour booklet which may be had by mailing the coupon below. Our purpose here is to answer questions that have been asked and to talk about the more prosaic business of getting started on the tour. Once we board the chartered Pullmans of the tour special we can forget our worries. So the first question that should be answered is:

Booklet Contains Full Information

Tour Manager, Pennsylvania Farmer,
7331 Penn Avenue, Pittsburgh, Penna.

Please send full information and illustrated booklets about the Pennsylvania Farmer Pacific Northwest Tour, July 26 to August 10, inclusive. This places me under no obligation of any kind.

Where can I join the tour train?

At any of the stations and at the time shown below. You can estimate the cost from the rate shown in the booklet for the town nearest you. When you tell us where you wish to board the train we shall give you the exact figure for that point. Here is the schedule for the start on July 26:

| Pennsylvania Railroad | |
|---|------------|
| Leave Philadelphia, Broad Street Station | 8:45 A.M. |
| " West Philadelphia | 9:15 A.M. |
| " Paoli | 9:23 A.M. |
| " Downingtown | 9:35 A.M. |
| " Coatesville | 9:45 A.M. |
| " Pottsville | 9:55 A.M. |
| " Lancaster | 10:23 A.M. |
| " Mt. Joy | 10:45 A.M. |
| " Elizabethtown | 10:55 A.M. |
| " Middletown | 11:10 A.M. |
| " Harrisburg | 11:37 A.M. |
| " Sunbury | 12:45 P.M. |
| " Milton | 1:00 P.M. |
| " Williamsport | 1:50 P.M. |
| " Lock Haven | 2:30 P.M. |
| " Driftwood | 3:10 P.M. |
| " Renova | 3:57 P.M. |
| " Emporium Junction | 4:31 P.M. |
| " Port Allegany | 5:14 P.M. |
| " Olean, N. Y. | 5:54 P.M. |
| Arrive Buffalo, N. Y. | 8:00 P.M. |
| Leave Buffalo (Michigan Central Railroad) | 8:00 P.M. |
| Pittsburgh and Lake Erie Railroad | |
| Leave Pittsburgh, P. & L. E. Station | 10:00 A.M. |
| " Beaver | 10:32 A.M. |
| " Youngstown, Ohio | 11:40 A.M. |
| " Erie | 2:07 P.M. |
| " North East | 2:47 P.M. |
| Arrive Buffalo, N. Y. | 4:05 P.M. |
| Leave Buffalo | 8:00 P.M. |

The schedule for extreme western and north-western Pennsylvania follows:

Where will tickets for the Pennsylvania Farmer Tour be on sale?

You will need no ticket. When you make your final payment, as explained in the Tour booklet, you will be mailed full instructions together with credentials to be presented when you board the special train. You will need no ticket to board the train. One of the tour managers will be looking for you and will have everything ready for you when you get on.

You call this an all-expense tour. Just what does that mean?

It means that every necessary expense for the round trip is included in the cost which is quoted in the tour booklet. The booklet is being mailed to you and all others who ask for it. A reservation de-

posit of \$20 per person reserves space on the train. A check for the balance of the cost should be made at least ten days before the beginning of the tour. Then you are through paying. The money will be refunded if you find later you cannot go.

It means that you can leave your pocketbook at home. Some one else will do all the worrying, buy all the tickets, pay for all the meals, do all the tipping. The moment you step aboard the special train you shift all responsibility to other shoulders.

My wife and I are 64 and in only fair health. Do you think we could stand the trip?

This trip is longer but no more arduous than the Florida-Cuba Tour which was enjoyed by people ranging in age from three to 75 years. Many of them were over 60 and one man and wife over 70 returned home saying they would join the next Pennsylvania Farmer Tour wherever it might go.

Each person can make the tour as difficult or as easy as he wants to. There are numerous mobile side trips, but plenty of free time has been allowed for rest, shopping or individual sightseeing. You will usually find company if you desire to remain in the train instead of making one of the tours.

Who will be going on the Pacific Coast Tour this summer?

That question is "a little previous." We can answer better two months hence. However, here is a guess based on the inquiries being received by the personnel of the Pennsylvania Farmer Pacific Northwest Tour of last winter. The party probably will consist principally of farmers, active and retired, and their wives. There will also be a considerable number of young people and some business and professional men and women, teachers and others.

Will you give me a reduction in the cost of the tour if I get several of my friends to go?

The announced price of the tour is the exact total of the various items that enter into the cost. There is no margin for discounts or profit. If we allowed you a discount we would be just that much short of the amount due the Pullman Company, etc., for your accommodations.

How much would it cost for us to take our son and daughter with us?

The railroads will allow reduced rates for children who occupy the Pullman section with their parents. We shall be glad to get this for you if you will write giving the age of your child.

What do we do on Sunday while on the tour?

We shall spend our first Sunday morning in Chicago, arriving in plenty of time for church services, sightseeing, or both, and leaving at 12:30 p.m. for Chicago Daylight Saving Time (11:30 a.m. Central Standard Time). A similar arrangement is a stopover for church attendance has been arranged at Spokane, Washington, on our second day morning. Members of the party will be returning home from early morning until late afternoon on the third Sunday, depending on where they

Milly Woodbridge's Trek to the Pacific

The Pioneers of the Peace River Valley

By C. A. Stephens

Copyright, 1930, by Casser Harrison-Steele, Inc.

SYNOPSIS

Two New England families, who have gone to the Peace River country in Canada to make homes, find themselves in unfortunate circumstances when the railroad, on which they had based their hopes, is not built near where they have settled. One of the families, the Mastermans, moves away, but the other, the Woodbridges, creates business for the sawmill they have built. The son and daughter advise following the Mastermans' example and go back to civilization while they still have enough money to make the journey, but the father refuses to leave his mill. At last, when it becomes evident that they could not live through another winter on the Peace river, and after their money had been spent, they started to walk across the thousand miles of wilderness, and mountains that stretched between them and the Pacific Coast. With a horse, a cow and later an Indian woman who joins them they cross rivers and forests in slow but determined fashion, living largely on game and fish. The extreme exertion together with wet weather seem to make the father's cough worse until one day he has a hemorrhage of the lungs, losing considerable blood before it stops. Later he seems much better and they go on with renewed courage. One evening the Indian woman, Pinky-Blue, while fishing encounters a grizzly bear and cub.

They might have shot it; but Milly was no doubt wise in dissuading him from so hazardous an attempt. A grizzly, particularly one with a cub, is an ugly customer to risk a shot at. Hunters are usually very cautious in attacking them.

But graver dangers than gray bears now menaced this venturesome little party of home-seekers.

For four days after their adventure at the Black Canon of the Omineca, the Woodbridges went along the river through a generally hilly, wooded country and on the fourth afternoon reached the bank of a good-sized creek, which would have to be crossed next morning.

Here as usual they first fenced their camp site for the night, then put out the Jersey and horse to graze. Afterwards Winthrop went to fish in the creek; and when the squaw had kindled a campfire, Milly sent her up the creek to explore for beaver dams; for, odd as it may seem to

The Cheerful Plowman

THE NORMAL LIFE

THE rain was beating down in sheets, the thunder roaring mad retreats, the lightning crazy with its power was burning up a summer shower, and hallooses big, and round, and mean, with rigor thumped me on the beam.

I was a league or more from home, but might as well have been in Rome, for one mile was as bad as ten. It was no day for traveling men. I saw a small house near the way, a tiny cottage small and gray, so there I plowed through rain and mud and struck the door with thump and thud. The door was opened wide enough to show a wizened face and rough.

"You are a stranger, that I see," chirped out a voice, "you frighten me, so hurry on. I have no place for any unknown stranger's face. You may be here to rob my purse, to murder me or speak a curse; so hurry quickly on your way. I cannot shelter you today. A stranger should not, feet on hoof, expect admittance 'neath a roof." So I plunged on through rain and mud, through hail, and sleet, and storm, and flood.

Now what was wrong with that old lass whose door-step strangers could not pass? Why, only this: she didn't live a normal life of take and give; she all too long had kept herself apart, secluded on a shelf. She had so long shut out the throng that even the good old world along that she no longer could detect the carols from the circus; she could not tell an honest jay from one with shifty eyes, a gentle Abel from a Cain.

Well, thank the Lord, there are but few with that dame's weak perverted view, and thank the Lord this hermit craze is seldom found in modern days. The free and honest, normal brain responds to strangers in the rain; the free and honest, normal heart has no desire to live apart. J. E. T.

many, they had found the flesh of the beaver, either roasted or boiled, more palatable than that of any other game animal found in that region. Beaver colonies abounded there, the lessened market value of their fur having led apparently to a marked increase in the beaver population in this remote place.

Pinky-Blue had been gone half an hour, perhaps, when the report of a gun was heard at a distance, in the direction she had gone, followed immediately by a second report. Milly supposed that Indians or miners might be in the vicinity and gave little heed to the matter; she was busy with her preparations for their supper.

Ten minutes had scarcely passed, however, when the squaw appeared, out of breath, heated from running and in a state of great excitement! She had, she gave Milly to understand, gone up the creek for some distance and had found not a beaver dam but three white men working a large, long "cradle" in the bed of the creek, washing the gravel, evidently for gold. She had come within plain sight of them before she saw them; and they looked up and saw her at the same moment. One of them said something hastily to the others, when instantly another of them snatched up a gun and fired at her. She heard the ball whiz past her face; and, as she ran away, they fired after her again!

Winthrop had now come back to the camp with his fish. "They caught a glimpse of Pinky and mistook her for a deer," he said. "Lucky they did not hit her!" Woodbridge, senior, thought this the more probable explanation. It was not to be supposed that white men would shoot a squaw.

Pinky, however, was in a state of consternation. She was beginning to learn certain English words from Milly. "Killy! Killy! Killy me!" she cried over and over.

"I would better find out about this," Winthrop said. "Of course it is some mistake." He took his gun and set off up the creek. Ere long anxiety so beset Milly that she interrupted her supper preparations and followed after him. Winthrop had proceeded cautiously and after going less than a mile, heard voices and the sound of a "cradle" rocking, also the noise of shovels. Beyond doubt it came from miners hard at work. He moved forward through the woods to the creek bank at a point fifty or sixty yards below, and coming in sight of the men, stood and watched for a few moments. There were three of them, and Winthrop did not wholly like their looks. A tent stood hard by; about it were scattered the usual tinware, tools and other outfit of a mining party. There was no doubt they were gold-seekers; and something in the feverish haste in which they were toiling led Winthrop to guess they had made a rich find there.

Miners are usually rough but honest fellows; Winthrop had little hesitation in hailing them. "Hullo there!" he cried. "Struck it rich, have ye?"

All three men stopped work on the instant and two of them ran to snatch up guns.

"Oh, don't go to shooting!" Winthrop shouted. "I'm a friend. I'm not here to meddle with you."

Winthrop has since said that in all his life he never heard anything like the volley of abuse, profanity and curses with which his wholly friendly salutation was greeted. The burden of it was for him to get out from there on the jump and never show his head there again under penalty of instant death! "Ef we ketch ye here agin, we'll hang ye up by the heels and cut yer heart out!" Winthrop remembered as one of the savage threats they shouted. One of them also fired a shot, but, he thinks, over his head.

EVIDENTLY they had no desire for visitors and Winthrop judged it prudent to beat a precipitate retreat. All the explanation that he or Woodbridge, senior, could hit on for such furious behavior, was that these men had found a bonanza and wished to keep all knowledge of it secret, since it is well known that when tidings of new, rich placers get abroad, a rush of gold-seekers is almost certain to follow. Milly and her brother conjectured that sudden good fortune and the fear of losing it had so excited these wandering treasure-hunters that they would even have committed murder to keep the locality a secret. As they reflected on this, their fears increased lest they might be attacked. First Winthrop and later Milly watched during the night. Twice the latter heard stealthy footsteps in the woods and once Brighteyes jumped up, but these alarms were very likely from bears or other wild animals.

(To be continued.)

When Jelly Will Not Jell

By GERTRUDE S. STEWART

WHILE teaching in one of our splendid cities of the great Northwest (where I hope many of you can journey with the Pennsylvania Farmer tour this summer), I greatly enjoyed the friendship of a delightful Scandinavian woman. She had asked me to stop in for tea after school one hot June day and when I arrived, I found her in a most unusual state of agitation.

"Well, Mrs. Hutton, what is bothering you this afternoon?" I calmly asked. "Oh, dear," she replied in exhaustion, "I bought a case of strawberries to make jelly, and have spent all day for nothing. They just refuse to jell." The boys have had so much to say about the strawberry 'jelly' that Roland's mother gives them for lunch, that I did want some, too."

Mrs. Hutton is a cook supreme but although the fragrance of her kitchen was most enticing the fruit jelly was a sad runny mess. I suggested that she go with me to the nearest grocery, just a short walk distant, and there we bought pectin enough to settle the trouble. In a very few minutes the jelly had jelled, and rows of shining glasses stood on the kitchen table. Then we happily sipped our tea with some jelly tarts thrown in. Her juices simply lacked the jellifying substance known as pectin.

Weeping Jelly—Sugary Jelly

Last year a large number of our readers wrote us inquiring why their jellies were wet and oozy on the top, and others wanted to know why some of their jellies often contain crystals of sugar. To avoid the "weeping," here are four cautions.

Never fill the glasses too full, but leave at least one-half inch for the paraffin seal. Second, let there be no splash of jelly left on the edge of the glass, for if not wiped away clean, the seal cannot be perfect. Third, pour hot paraffin immediately over the hot jelly. Next morning, pour another layer of hot paraffin, this time tipping and rolling the glass so that the hot paraffin will cling well around the edges of the glass and complete a perfect seal. Lastly, avoid jarring the jelly at any time and store in a cool dry place.

Now let's settle the sugar crystals. If they are scattered throughout the glass, the cause is usually too much sugar for the used quantity of juice or pulp. Often crystals form at the top of the jelly because it is not sealed immediately. Let's get the habit of pouring a thin seal of paraffin the minute we have poured the jelly. The mass is then protected against the action of air, as well as from dust and other contamination in the air.

How would you like to eliminate all guess-work from your jelly making this season? Why work all day at a task that can be completed in one hour of well-directed work? Why stir and stir over a hot stove wasting fuel and growing wrinkles all over your tired face when the same jelly can be better made in a short time at very little fuel expense?

We can supply you with a book on jelly-making giving methods and recipes for all the fruits beginning with the luscious strawberry and winding up with late autumn cranberries. These recipes are tried and true. They are easy for they use the short-boil process. The products taste better for the flavor has not all boiled away. The color is perfect for long boiling dulls and darkens. This help will off-set worry, your jelly will jell and your purse will be saved for you are sure of success.

Let us send you this recipe book and with it

another interesting one with illustrated uses to vary the diet with jams and jellies. Please send a strong self-addressed envelope—ready stamped with your request. If there are some other home problems puzzling you, send them right along, and we'll help you if we can. Address your letters to Home Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Timely Tips

WE make a good chocolate syrup of equal parts cocoa and sugar mixed together, then stirring in gradually twice the amount of water, adding a pinch of salt and, if desired, a little vanilla. Use one-half cup each of cocoa and sugar and one cup of water. This syrup is used in milk, with malted milk for milk shakes, or as a sauce on ice cream or puddings.

Clear sparkling jellies of beautiful transparency are made possible when juices of well-ripened fresh fruits are dripped through bags of cotton flannel. Short-boil methods retain colors which long, slow boiling destroys.

gradually, salt, pepper and a pinch of mustard to season. Then add gradually, beating with egg beater all the while, one cup of a good salad oil. Keep in a covered jar. This makes a delicious, thick, smooth and creamy product.

It is easier to prevent than cure corns on the toes. Whenever there are corns, the feet have not been properly shod. Remember this when buying shoes for the girl of high-school age, for this is often the time when corns first appear. Nowadays a girl may be neatly and stylishly shod, and still keep foot health and comfort.

For the new, beautifully finished sewing machine, make an oilcloth cover to put over it while you are sewing and protect it from scissors, pins, etc. Cut the cover just the size of the machine when open, cut out an oblong where the sewing apparatus comes through.

Space Savers

WE had no place for the many magazines in our house that we want handy when we have a few minutes to read. We have wainscoting in our kitchen and I thought of nailing a shelf across one corner, just above the couch. It solved the problem.

The atomizer stood on a crowded mantel. After it was thrown down and the glass cup broken, I put a little shelf above the one for magazines, and we keep the new one there.

Mrs. W. E. H.

The Innocent Fly Is Attacked

THIS story is one of a series prepared under the Gorgas Memorial as part of its program for Better Health and Longer Life. Dr. Isaac D. Rawlings, Director of Public Health in the state of Illinois, wrote this very rousing story which we hope you will read all the way through, and let the wise counsel guide in an active campaign against the common fly, far too abundant in country homes.

A keg of gunpowder resting quietly in one corner of a warehouse is one of the most harmless looking objects imaginable. The eye of man is so powerful enough to see the tremendous power that lurks behind the dull, black, lifeless appearing color.

Flies are very much like that. To watch a fly crawl across the table or the wall, one can detect nothing but the most innocent looking insect.

Gunpowder is perfectly harmless until it comes into contact with fire or some other heat generating substance. Flies are perfectly harmless until they begin to associate with disease germs. The flies have the worst manners of any living creature. By birth and inheritance they belong with the scum of the earth, but the moment they learn to propel themselves into the habitations of God's most favored creature and they cease to want them and into the inner chambers of the most exclusive homes.

If the human eye were a powerful microscope the feet of a fly which had just returned from one of his filthy debauches would look like a mess. One fly can carry a load of germs big enough to set off an explosion of severity sufficient to shock the life out of a human being. A fly likes to eat at the table with the daintiest housewife, but he hasn't the grace to wash his feet before the meal and he enjoys dipping his fingers into everything that's good to eat before the people get a chance at it.

Fortunately the dastardly character of the fly has been found out so that he can no longer play his evil without being under surveillance. People have learned to attack him in three or four ways. First, they screen their homes to keep him out. Then they deposit waste matter in fly-tight cans or in flush closets so that the fly cannot reach it. They destroy excreta from the sick so that he never get to them. They clean out stables once a week and spread or bury

Rolls

DOUBLE-DECKER rolls made of quick yeast dough, rolled thin, lightly buttered and two rounds baked together in a muffin tin are ideal. To butter the top round can be left off without destroying the roll. Cheese biscuits made of an ordinary baking powder dough to which soft cheese has been added lightly are delightful with hot tea.

To keep the bright color in strawberry preserves, cook rapidly.

Your Laundry Water

and Gas to heat it....

BOTH with a National FRESH WATER SYSTEM

WATER for washing—soft, clean water! Your one National system pumps from several sources at the same time—direct from well, cistern, stream or lake—any lift up to 150 feet.

And now your National performs a second great service—supplies gas for water heating, room-heaters and for cooking. Gas that's three times hotter than city gas—piped dry and clean into the house from an underground tank outside. Gas at a touch of a match and the turn of a valve, without burners to generate.

Enjoy both fresh, running water and gas for heating and cooking for only 10¢ to 30¢ more than the reasonable cost of a National Fresh Water System alone.

Write for FREE Catalog and easy time-payment plan. NATIONAL UTILITIES CORPORATION. Subsidiary Westinghouse Air Brake Co. 295 Bellevue Place Milwaukee, Wis.

CALHOUN CHICKERIES, Box D, Calhoun, Mo.

TWO HELPERS INSTEAD OF ONE IN EVERY BAR That's why

FELS-NAPTHA MAKES WASHING EASIER

WHETHER YOU SOAK OR BOIL YOUR CLOTHES

Wash your own way. Boil the clothes if you like. Soak them if you prefer. But use Fels-Naptha—and you'll get clean, sweet, snow-white washes without hard rubbing!

For Fels-Naptha gives you extra help—any and every way you use it. The extra help of plenty of naphtha, the dirt-loosener, and good golden soap, the dirt-remover. You get two cleaners instead of one in every bar. And working together, they gently loosen dirt and wash it away—in water of any temperature.

Test this extra help yourself. Try Fels-Naptha in machine or tub. For soaking or boiling. In hot, lukewarm or even cool water. You'll find that it works quickly and gets your hands out

of water sooner, which helps keep them nice. Get a few bars of Fels-Naptha—or the handy 10-bar carton—at your grocer's today.

SPECIAL OFFER—We'll be glad to send every user of Fels-Naptha Soap a Fels-Naptha Chipper. Many women who chip Fels-Naptha into their washing machines, tubs or basins find this chipper handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naphtha!) just as you need them. Send only a two-cent stamp to cover postage, and we'll mail you this chipper without further cost. Write today. Department 7-5-24 Fels & Company, Philadelphia, Pa.

THE GOLDEN BAR WITH THE CLEAN NAPHTHA ODOR FELS-NAPHTA

Kill Rats Without Poison
A New Extremator that Won't Kill Livestock, Poultry, Dogs, Cats, or even Baby Chicks

Why Turkeys Die
Disease kills thousands of Turkeys. Sanitation and Syrac will help prevent much of this loss, at a cost you can well afford. Trial size Syrac \$1.00; C.O.D. if you wish. Give it a trial. Value ten times book price.

WOOL
—BLANKETS—
and Colonial Coverlets. Made from your own wool. Also sold direct if you have no wool. Beautiful goods that give satisfaction and long wear. Write for catalog and samples. Prices reasonable. WEST UNITY WOOLLEN MILLS, 107 Lynn St., West Unity, Ohio.

"Going to town"

Not so long ago, the trip to town was a momentous event. It took hours. You bought enough to last until the next trip, but it was hit-or-miss buying. Food in open barrels or boxes. Gloves, rubber boots, bolts of cloth and buggy whips thrown together in hopeless confusion. Sometimes you were lucky—but not always. The day was gone when you reached home again.

Now you hop into the car, swing out on the state highway, and speed smoothly to town at forty miles an hour. The store you enter is modern, clean. Buying is a simple matter. You ask for this brand of breakfast food or flour—that kind of shoes or flashlight. Packages and brand names are your guide. You know that you're getting the best products for the least money.

Advertising has simplified the whole process. It has told you the merits of the car you drive, helped you to have good roads to run it over. It has brought you the machinery that lightens farm labor and gives you leisure to get away more often. It has explained the fertilizers that mean more money for your crops. In every way it is continuing to make your life more comfortable and pleasant.

Advertisements pay you in time and money. Read them regularly.

THE YOUNG PEOPLE

Protect the Birds

DEAR Editor:—Here is an essay on birds, how to protect them, care for them and a simple bird house built from cans.

I am a boy who has lived in the country all my life. I go to Dublin High School. Science is one of my favorite studies. We are going to study birds. The past winter we had a bird feeder made and put it outside our window at school. At home I have several bird houses tacked here and there. Carroll Morris, Jr., Maryland.

By Jamarik Agers

Many a boy thinks just because a bird is alive it is a proper target for his air rifle or his sling shot. We are the birds' police, especially the Boy Scouts. After all, what is the value of a bird after it is shot, except a few scientific specimens collected by trained museum experts?

Many a hawk and owl has been killed as a harmful bird because it was seen to capture a young chicken. We should post ourselves on the subject and find that most hawks and owls feed chiefly on field mice and large insects injurious to the farmer's crops.

A band of nuthatches worked all winter in a pear orchard near Rochester until the trees were entirely free from a certain insect that had destroyed the crop of the previous summer. A pair of rose-breasted grosbeaks were seen to feed their nest of young ones four hundred twenty-six times a day, each time with a billful of potato bugs or other insects.

A professor in Washington counted 250 tent caterpillars in the stomach of a dead yellow-billed cuckoo and he found 500 bloodthirsty mosquitoes inside one night hawk.

Many bird boxes can be made in a little while by doing only a little work. They can be made out of tin cans and auto tires. A wren house can easily be made out of a flower-pot. Another way to attract birds to your homes in the summer is by providing drinking fountains and bathing places. A little pool of water protected from cats will be a source of joy to the birds.

By Lella Southall, West Virginia.

About Our Farm

I AM going to tell you about myself. I am 13 years old. I am a Junior in high school. I have one sister; she is 12, and is a freshman.

We each own a Holstein pure-bred cow. They are twins. Mine is "Betsy" and my sister's is "Peggy."

My cow has had two calves. The first one died, and I sold the other one for veal. He weighed 150 pounds.

My sister's cow has had two heifer calves. She calls them "Princess Sylvia" and "Charmaine."

When our calves were two years old, they won second and third prizes at our calf club.

We live on a farm. There are 260 acres on it. We have four horses, 12 cows, five heifers, several small calves, pigs, sheep and chickens.

We have three dogs. One we call "Buddy." She will bring the cows, and she waits every night for us to come from school.

One day in April, four years ago, my Daddy saw a lamb running around in the field. He found its mother, but she wouldn't claim it. He said if we

girls could raise it we might have it. We got a bottle and fed it. We raised it and it is big now. The first time we clipped her we got seven pounds of wool. Succeeding years we have gotten nine and eight pounds each. This spring she had twin lambs. We called them "Tom" and "Jerry." "Tom" was real black. He weighed 95 pounds when we sold him. "Jerry" was neither black nor white. He weighed 93 pounds when sold. They were four months old when sold. We still have the mother. We call her "Cato." She is out all winter. She won't stay with the rest of the sheep. I read the Young People's Page, and enjoy it very much. I know I would miss it a lot, if it were discontinued. Elizabeth Judy, Pennsylvania.

Another Queer Pet

I HAVE the queerest pet that ever was. Can you guess what it is? It is a little pig with a curl in his tail. He is about two weeks old.

When his meal time comes I hold a bowl in front of him, half full of milk and say: "Wac, wac, wac." And he will squeal and run and jump into the bowl, feet and all, and when he has finished he will try to root the bowl over.

The mother pig had four little babies, but she lay on all the others and killed them. I took this one away and kept it from her.

I have been trying to think of a name for him but every one I think of my tongue gets twisted in trying to say it fast, therefore, I call him "Piggie." Melvin John Pierce.

When We Entertain

ONE of the players starts the game by saying "one," the next "two," the next "three," etc., until "seven" is reached, when the word "buzz" is substituted for it. The next player says "eight," and so on, up to a multiple of "seven," or any word in which "seven" occurs, such as seventeen, twenty-seven, thirty-seven, etc.

When "seventy" is reached the counting proceeds as "buzz," "buzz-one," "buzz-two," etc., and seventy-seven is "buzz-buzz." Whenever a player says a number instead of "buzz," or says "buzz" in the wrong place, he must start the game over again by saying "one." The game may also be played by having each player who misses drop out of the game.

Crazy Stories
Cut exciting short stories into paragraphs. Mix and pass out to players seated in circle. One reads paragraph to start and reading continues to left. A queer story results.

He Can Do Little
One player takes a stick in his left hand and thumps the floor with it, saying "He can do little who can't do this." Then he hands the stick to another player, who will probably use his right hand when holding the stick and thumping. If he does, he is told he has failed in the simple task and the stick is handed to another. The game goes on until someone discovers that the secret of the trick is to copy the leader exactly and therefore the stick must be held in the left hand.

Youth's Problems

By Helen Blum, West Virginia
Four-H Club Member

YOUTH in the Eastern Panhandle of West Virginia has laid down the bars between various organizations and regions.

In a recent conference at Charles Town, 130 boys and girls representing Four-H clubs, Hi-Y, Y. M. C. A., Y. W. C. A., Boy Scouts, Girl Scouts, Girl Reserves, high schools and several other groups, met to consider their life problems.

Robert G. Foster, Four-H agent in the eastern states for the U. S. Department of Agriculture, was in charge. Local high school principals, county and home demonstration agents, ministers, Vo-Ag men, Four-H leaders, extension agents and others aided.

Topics Discussed

The topics which the delegates discussed were: "What are some of the things I should know before determining my life's work?" "How am I to know for what life occupation I am best fitted?" "What are youth's experiences, and how shall they meet them?" "What are legitimate experiences of youth?" "How can youth bring about a better understanding between itself and older people?" "Do I need to belong to any organization?" "How can I prepare for my life's work?"

A typical group was that which discussed, "How am I to know for what life work I am best fitted?" It decided:

One may find for what occupation he is best fitted by asking, reading, actual contact and observation. Qualifications: 1. One should like his work. 2. Understand thoroughly what is required of him. 3. Make a self-analysis.

One should consider environment, cooperation and remuneration. Benefits of Conference
Through this conference organiza-

Little Folks' Corner

Drawn by Elsie E. Freeman, Pennsylvania.

COLOR THE PICTURE AND WRITE A STORY

CAN'T somebody tell us what these little girls are doing or why they are wearing such big, big sunbonnets? Color the picture and write a story about it. There will be ten surprise prizes for the best.

Send your letter to Little Folks Corner, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

YOUR TURN TO WIN A PRIZE

Try your hand at our new contests and win one of the twelve fine prizes offered for the best. Here they are:—

- Cartoons—1. The Kicking Cow.
2. The Balking Mule.

Letters on—

1. Who Would You Rather Be?
Not Yourself?
2. My Most Exciting Adventure.

All letters must be in before May 31. Address Young People's Editor, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

tions are taught to pull together; the boys and girls learn to think individually; they learn to express themselves clearly and forcefully; and they make new friends.

Officers were elected to prepare for a similar conference next year, the third to be held.

CHATTER-BOX

By Eva L. Hughes

THERE are so very many things that I should like to know: Why is it that a cow has horns That never, never blow?

The elephant has a trunk, and yet The poor thing wears no clothes. The garden has no legs, but many Stores sell garden hose.

I wonder if I'd better do The thing Big Brother said.... I asked him all these questions And he growled, "Go soak your head!"

VACATION TIME

GOOD-BYE, little desk at school, good-bye. We're off to the fields and open sky. The bells of the brooks and woodland Are ringing us out to the vales and dells. To meadows way fair, and hill tops cool. Good-bye, little desk at school.

Good-bye, little desk at school, good-bye. We've other brave lessons and tasks to try. But we shall come back in the fall, you know. And as gay to come as we are to go. With ever a laugh and never a sigh— Good-bye, little desk, good-bye!

Helen M. Rafferty.

PASSING EVENTS IN PICTURES

(Copyright by Underwood & Underwood)

1. New York.—Photo shows "sinkers" that went sink: the electric doughnut machine on board the U. S. S. Texas, which turns out thousands for the sailors on board. Fireman George F. Morris is operating the machine.

2. Photo shows American, Scotch and French Canadians—left to right, Douglas Fairbanks, Harry Lauder, who are both sailing for England, and Maurice Chevalier, who came down to the Mauretania to see them off.

3. Chicago, Illinois.—The whole country was represented in the national baby week

campaign. In one welfare station in Chicago the following lineup appeared: Left to right, Marina Dumit, Syrian; Frederick Piesen, German; Richard Van Der Heyden, Dutch; Dave Solmeyer, Roumanian; and Richard Rother, Spaniard.

4. Chicago, Ill.—The complete Western Television receiver fitted for reception of both sight and sound, the picture is projected from the aperture at top of cabinet onto screen on pedestal in front of set, and can be viewed and heard six feet or more away.

5. Photo shows natives in Palestine using their feet to crush grapes—the juice to be used in the making of wine (for religious purposes). 6. Burbank, California.—Ready to fold up their wings! An excellent shot of the U. S. Army Air Service planes closing their annual maneuvers at the United Airport here, in the presence of about 150,000 spectators. This view was made during the review of the provisional wing by Maj. Gen. James E. Fechet as the maneuvers were directed via radio by Brig. Gen. Wan. E. Gillmore.

MORE PROFIT WITH OVERSIZE CHICKS

SIEB'S CERTIFIED CHICKS

If you want larger stronger stock, more eggs, more meat, and more profit, raise Sieb's "Oversize" chicks. They are all from guaranteed pure bred flocks of the world's finest blood lines. These chicks are especially bred for the business man or woman that raises poultry for profit.

WHY SIEB CHICKS PAY BETTER

It costs just as much to raise a chick that weighs 6 lbs. at 6 months old as it does a chick that weighs 8 lbs. at 6 months old. It also costs just as much to raise a chick that lays 60 to 80 eggs per year as it does a chick that lays 200 or more eggs per year. We have spent huge sums of money developing the finest pure bred quality only—breeding and improving that one quality from year to year, making them grow larger, mature quicker, and lay better, until they have reached perhaps the highest degree of perfection as money makers. Our great capacity of over five million per year and breeding of one quality only cuts down cost and enables us to give you five million chicks at prices even less than many hatcheries charge for 500,000 and 1,000,000 chicks.

8100-158200-158300-158400-158500-158600-158700-158800-158900-159000-159100-159200-159300-159400-159500-159600-159700-159800-159900-160000-160100-160200-160300-160400-160500-160600-160700-160800-160900-161000-161100-161200-161300-161400-161500-161600-161700-161800-161900-162000-162100-162200-162300-162

Truck Crops

By GILBERT S. WATTS

Freshness Wins Before Others Start

NO we are not reporting horse races in the truck crops column. However, such a startling headline is demanded to present the decisive results of a questionnaire on roadside marketing that was sent to 2,400 Massachusetts consumers. Of the 1,323 persons who considered roadside markets a satisfactory place to buy fruits and vegetables 1,120 gave freshness as their reason. That leaves price with 247, pretty far down in the odds.

Of the 673 persons who have not found their roadside marketing experiences satisfactory the reasons given were poor quality and lack of freshness 392, price not right 180, poor service 107, and some other reasons in minor numbers.

Display Stops Them All

Thus we might continue our headlines, for Display certainly did run away with the race in answer to the question, "What makes you stop at a roadside stand?" The winnings were: Display 1,494, Convenience 276, Reputation 133, Curiosity 90.

Eighteen hundred and twenty-two bought vegetables, 1,574 bought fruits, 223 bought poultry products, 164 bought cider, 78 bought flowers and 39 bought dairy products.

Other answers worthy of digestion are those to the question, "Would you buy oranges, bananas, grapefruit if the stands had them for sale?" Yes, 373; No, 1,673. No judge's decision about that: the majority expect native farm products at roadside markets.

Probably no vegetable loses quality more rapidly after harvesting than sweet corn. All of which means that there is a special opportunity to build a roadside market trade for sweet corn that is better than the best that many city dwellers ever have tasted. Rich soil, succession plantings, timely picking and immediate marketing will turn out a product that will bring customers back repeatedly and in increasing numbers.

Our 1930 Roadside Markets

Planting time is at its height. Selling time is at hand for those who made an early start. The highways carry ever increasing herds, flocks, droves, swarms of automobiles. Those who possess the vision—and management—to offer, as we said of the sweet corn, things that are better than the best that many folks know are not likely to go without reward.

Dip the Sweet Potatoes

STEM rot, black rot and scurf, three common diseases of sweet potatoes, cause excessive losses annually, says W. H. Martin, New Jersey plant pathologist.

The losses from stem rot may be greatly reduced by growing resistant varieties such as the White Yam or Red Brazil, or the more resistant strains of the Yellow Jersey. Seed selection is likewise an aid.

The first requirement for the control of scurf is the bedding of clean seed that has previously been disinfected in one of the mercury compounds. Even where this practice has been adopted, however, the disease has not been eliminated and experiments have been conducted during the last four years in an effort to obtain a simple, efficient method of control.

This method of disease control is simple. The organic mercury compound used is made up at the desired concentration in a wooden container. The sprouts are pulled and dipped into the solution. When dipping the sprouts, try to keep the chemical from the leaves of the plant. Only the underground portion of the plant should be dipped.

Make the Harvest

faster, easier, and cheaper

with a new

McCORMICK-DEERING Binder

THE 1930 models have many time- and grain-saving features that are not on older machines. Nine ball and roller bearings at the important points lessen the draft and assure smooth, frictionless operation. More space between the main wheel and main drive chain eliminates accumulation of dirt and undergrowth. The controlling levers are easier to reach and operate. You have a choice of either McCormick or Deering binder attachments.

But these are only a few of the many features that have been added to make the harvest easier, faster, surer, and more profitable. Only by seeing the machine can you fully appreciate how much progress has been made in binder construction. Ask the nearby McCormick-Deering dealer to show you.

Get Rid of CANADA THISTLES

The Little Wonder Weed Exterminator will positively destroy them.

A spraying solution (not a chlorate); costs only 6c per gallon; will not ruin the soil nor kill cattle. Write for free illustrated booklet.
REBER CHEMICAL COMPANY
Reading, Pa.

THE FARRELL HOIST

FOR UNLOADING KEY WITH GAS ENGINE. HAS QUICK RETURN DRUM AND BAND BRAKE. BOTH DRUMS OPERATED FROM LEVER BY ONE HOPE. SEND FOR CATALOG.

JOHN FARRELL & SON
NEWTON, MASS. CO. N.J.

MARUGG'S SPECIAL

MARUGG'S GERMAN "Dangle-Edge" SCISSORS. Exclusively made and imported by us since 1872. Are praised by Poultrymen, Apiarists, Nurseriesmen, Farmers and Caretakers of Lawns in every State. Catalog free. Address: The Marugg Company, Dept. F, Tracy City, Tenn.

STANDARD GARDEN TRACTOR

A Powerful Tractor for Small Farms, Gardeners, Florists, Nurseries, Fruit Growers and Poultrymen. **VOICES & MEN'S WORK** Walking & Riding Equipment. Free Catalog—Does Not Cost a Cent.
STANDARD ENGINE COMPANY
Minneapolis, Minn. Philadelphia, Pa. New York, N.Y.
3271 Como Ave. 2425 Chestnut St. 181 Cedar St.

HAUCK WEED BURNERS

The modern, sure way to kill weeds. Use them before they grow—scale and scurf. Easy to use, quick, cost half of old methods. Used by gardeners, florists, nurseries, parks, cemeteries, and grocers. Write for free catalog.

When writing Advertisers please mention The Pennsylvania Farmer

Wherever you live or drive—whatever the oil company's name or brand associated with it—any pump bearing the Ethyl emblem represents quality gasoline of anti-knock rating sufficiently high to "knock out that 'knock'" in cars of ordinary compression and to develop the additional power of the new high-compression models.

...and one of the best things about Ethyl is that it also saves money

HERE are some specific reasons why Ethyl Gasoline means real economy, whether used in your car, or truck or tractor:

1. There's less running in second. This saves fuel.
2. It "knocks out that 'knock'." This lessens vibration and wear and tear on your engine. Depreciation is slower. Repair bills are less.
3. You have to lay-up less frequently for carbon removal. That saves money and time.
4. You cover more ground in less time with Ethyl—with your car, truck and tractor. And on any

farm, time saved is money earned at the end of the year.

Ethyl does this because it is more than gasoline. It is gasoline plus the Ethyl anti-knock fluid which leading oil companies add to their good brands to form Ethyl Gasoline.

Look for the Ethyl emblem. Be sure you are getting a premium fuel that is worth a premium and will save you money in the end.

And remember that in older cars Ethyl means as big an improvement as in newer models. Ethyl Gasoline Corporation, Chrysler Building, New York City.

The active ingredient not used in Ethyl fluid is tetra-ethyl lead.

Farm Facts and Fancies

By ALVA AGEE

AMONG the marvels of nature is its persistent effort to build up soil fertility. All the time many forces are at work. Man interferes because he must have food and clothing from the soil and has decided preferences about what he wants. Some of the interference is a benefit, causing fertility to increase. The greater part of the area we farm is the loser by man's control. It would have been better off if it never had been in the power of the human race that thinks pretty highly of its own intelligence and ability.

The Vegetarian

The Indian was a meat-eater, and that favored the soil. I know little about the relative merits of meat and vegetables as human food, but all this teaching that we should use more vegetables and fruit, and cut down on meat, rather directly affects soil fertility. That is not true of the individual farm whose owner makes commercial fertilizers and legumes add to supply of plant food while vegetables and grain are grown for market, but I am speaking of the country as a whole. The land has less chance of lying happily covered by sods and of storing up rich organic matter.

Another thing the vegetarian does: he reduces the number of acres required to feed the people. It takes far more land to feed a family that eats meat freely than one using chiefly bread, vegetables and fruit. The drift from meat is one reason that we find we have too much land.

I am advocating nothing and defending nothing, but am trying to state the case so far as the responsibility of our vegetarians goes. They may be wholly in the right—and may not—but the effect on the land is as stated. The interference with nature's program of soil-building by keeping the land covered with sods is far reaching.

The Farm Owner

More important than the effect on the soil is that on the owner of the land when fertility is not maintained because sods have been taken out of their rightful place in the farming scheme. The fact that some men keep their land rich in a close cropping rotation does not help the owners of farms that are losing in fertility.

It is disheartening to see fields that are growing poorer while making some contribution to their owners' crops but nothing to the owners' profits. There is a lot of land like that, and neither the greater part of it nor its owners ever will be comfortable until it goes back into nature's scheme of soil improvement and is given a sod and is allowed to keep it. The results from the sod are heartening to all concerned.

Helping to a Sod

Right here is the lame place in such a plan: if the land has been cropped, lime, phosphoric acid and potash have been taken out; if it has been pastured, the same thing has taken place. The owner has been draining available mineral plant food out of it. When it is proposed to let nature use sods for its improvement, that improvement will be slow unless the mineral supply is replenished for the grass. Some headway is possible even when the lime is ignored, redtop and alsike clover producing a covering for the ground, and putting some organic matter into it if phosphoric acid is supplied.

But this land should be left in sod for years, and pasturing is the means of making it pay its way. The outstanding pasture grass is bluegrass, and it must have lime. Lime and phosphorus help bluegrass and white clover, and these make a sod that lets land do its soil-building. Such a sod adds to the soil's stock of good organic matter year after year, if it is not pastured close.

Probably nine cases out of ten, when a farmer plans to plow down a heavy bluegrass sod he would do well to change his mind. It is too much like selling government bonds for the reason that the cash returns are not as great as something else promises. We speak of certain soils being "live" or "friendly" in like fashion we can say that land under a good sod of bluegrass and white clover is "comfortable," and that is all to the owner's good.

What Next?

It is clear enough that the Federal Farm Board, acting under the present law, is not getting the results it expected. The price of wheat is very low, the government owns a lot but does not let the public know how much, the cooperatives are heavy holders, and the stored wheat is in the way of the crops of new wheat that will be coming on the market in a few weeks. In the meantime all other countries except Canada have found a market, and Canada has unloaded a part of her crop.

The law, as it now is, does not give satisfaction to anybody. The attempt to regulate price will not be dropped at this stage, and the only question, as I see it, is what will be the next move. Probably it will be an attempt to place a bounty on exports. The aim would be to raise the price of the wheat consumed at home by the amount of bounty per bushel payable on that exported. If the bounty plan is adopted, we shall see other countries retaliating, and commercial relations between ourselves and Europe will be unfriendly.

There is one result from attempted price-fixing that we shall see pretty surely. Naturally the countries that are dependent on imported wheat for their bread do not like what we are trying to do. The production of wheat in Russia, Southern and Western Europe and the southern hemisphere will be encouraged to relieve them of any dependence on this country. There is danger that our export market may be permanently affected.

What we need is a clear-headed statesman who really knows what is the greatest practicable service to agriculture that our government could render, so far as surplus production is concerned. Our next need would be the ability to believe in him and his policy.

There's a Reason

ON the editorial page of the Pennsylvania Farmer recently appeared a short item on Farm Help. Also, another editorial, A Real Problem. This second editorial goes a long way toward answering the question raised in the first as to the reason you have received no requests for farm help this month.

Farming has fixed charges in the form of taxes, insurance and a definite overhead. We are forced to meet these rising costs from a value-declining source of revenue. And we face the unusual situation that when the labor we so long had sought on our farms was available from industry, our condition is largely such that we cannot afford to hire it.

Three years ago we had twenty hands in our threshing ring, last year twelve, this year eight. The acreage is the same. I do not know of any farmer who will keep a hand this year.

So the reason we are not demanding farm help is because we have a real problem on our hands. A problem which our farmers will in time work out, confident that theirs, as a basic industry, must survive, and looking for leaders and legislators wise enough to acknowledge that the basis is the earnings of the investment dollar and not an artificial valuation of their soil. S. H. Green.

The Story of Woodbine Farm

By W. D. ZINN

IHAD taken notes of the evidence of the defense and this I went over until I had the statements of each witness clearly in my mind. At nine o'clock Court convened and I had the opening address to deliver. I reviewed the evidence of the plaintiff step by step and spoke of the character of my witnesses and I stressed the fact that they, in no measure, were interested. I then reviewed the testimony for the defense and contrasted with those of the plaintiff.

My legal friend made a good and able plea for his client but, as he told me in after years, he felt all the time that he had no case. The noon hour came before he was through with his argument, so we recessed until one p. m. when he concluded his argument and I spent a short time in summing up the evidence on both sides. The Court found in favor of the plaintiff. The defendant promptly appealed the case to a higher Court.

The Cow Chase

Two months before the hog transaction I had sold some fat cows to Mr. Smith. One of these cows I did not see before selling her, neither did I see her when she was weighed up to Mr. Smith, but he saw her before he bought her. He sent a boy with a dog to drive the cows to Elkins, a distance of 20 miles.

The one cow that I never had seen stood in a stall for 52 days, never being turned out. She had made a remarkable gain. Not being accustomed to traveling, the drive with the dog chasing her proved too much for her. She never ate anything after she reached Elkins and died in a few days.

It happened that the note for these cows fell due the day that I got judgment against Mr. Smith for the value of the hogs. Mr. Smith tendered me, on that day, the amount of the note less the value of the cow that had died. Of course I declined to accept the money and before I left the Court room brought suit on the note. I had succeeded so well in the hog case that I decided again to employ no counsel.

The day for the second trial came on and again I found that Mr. Smith had an army of witnesses summoned to prove that he had purchased of me a diseased cow. This law suit, however, did not "get on my nerves" like the first one. I was becoming seasoned to it and it caused me no loss of sleep.

I had bought the cow of a Mr. Lance. I had as my witnesses Mr. Lance and the gentleman who weighed the cow to Mr. Lance and also weighed her to me. These witnesses said that they had never seen a healthier cow nor one that had taken on more weight in so short a time.

"Stumped" by Legal Term

In arguing the first case I called the attention of the Court to the fact that my lawyer friend had read no law in support of his side of the case. Afterward I learned to my sorrow that I had talked too much. When my friend the lawyer began to argue this case he had on his desk an armful of law books. He had not proceeded very far until he told the Court that he wanted to call its attention to a law called the act of "Recoupment." He then explained that the defendant had a right to off-set the account of the plaintiff by any amount that the plaintiff might owe the defendant.

The recoupment "stumped" me. I did not know what it meant at first, but I began to apply the little I knew of Latin and came to the conclusion that recoupment meant to off-set. I was not very sure of my ground, but as I had to do something I arose and said: "If the Court please, the plaintiff admits that if the defendant has (Continued on page 12.)

SIDEHILL FARMS PUT GAS TO A REAL TEST

WHEN a tractor has to buck a grade in addition to pulling its load—then's the time the quality of the fuel you're using shows at its worst or best!

Put **ORANGE AMERICAN GAS** up against the toughest job on the farm—that hilly field that slopes all ways at once—that holding stretch that always made your tractor strain so hard before.

Watch what a difference **ORANGE AMERICAN GAS** makes in the pulling power! We won't have to do any talking after you've made one fair trial! You'll know that this is a gas packed with power—a gas that makes hard jobs easy—that speeds up every day's work!

And for the best results—use **AMOCO TRACTOR OIL** side by side with **ORANGE AMERICAN GAS**!

Ask your **AMOCO** dealer, call our closest branch or write direct for further information.

The **AMERICAN OIL COMPANY**
Affiliated with Pan American Petroleum & Transport Company
General Offices: American Building, Baltimore, Md.

"Satisfaction for 20 years"

—writes W. C. Nash, Mt. Kisco, N.Y. "Crows did not take a stalk this season," reports H. O. Miller, Lucas, Iowa. "Works fine in the corn planter. Impossible to get 2 grains to stick together," says Eli W. Meyers, R. D. No. 1, Doylestown, Pa.

With a successful record of over 20 years behind it, Stanley's Crow Repellent is the one sure cure for crow troubles. Not only crows, but moles, squirrels and all pests leave your cornfield severely alone, if you treat your seed corn with Stanley's Crow Repellent just before planting. Yet it is not poisonous.

Large can, enough for 2 bu. of seed-corn (8 to 10 acres) \$1.50. Small size can \$1.00. If your hardware, drug, or seed store doesn't have it in stock, order direct. "Money Back" guarantee. Address The Cedar Hill Formula Co., Box 500R, New Britain, Conn.

Be sure you get STANLEY'S CROW REPELLENT

Read the Advertisements

Advertisements give you a high point of view without any climbing at all. They spread world products before you—servants to serve you, conveniences to please—prices low because so many thousands are using the same. They give you a new conception of what you'd like to own. No longer will a watch or food chopper do—but the highest improved watch or food chopper. No longer just a radio—but one of purest transmission. They make you change your mind about what you started to choose, and choose something more pleasing at no higher price. They help you see the whole field of satisfying wares. They lift you to fresh joys.

Know the Satisfaction of Owning a John Deere

THERE is real satisfaction—real economy—in owning a binder you can depend upon—a binder that will stay on the job day after day, doing good work without expensive delays.

John Deere binders are giving this kind of service on thousands of farms—they have built a reputation for dependability.

The John Deere Ten-Foot Tractor-Binder, shown above, offers you the utmost in binding capacity and efficiency. Driving the tractor from the binder seat, as illustrated, gives one man control of both machines. Here is a real labor-saving, cost-cutting outfit.

Driven by the tractor through a power take-off, the John Deere Tractor Binder handles heavy crops, down and tangled grain with ease. The flexibility of its elevators, the good work of its binding unit and its sturdiness of build are other features you'll like about it.

The Light-Running New John Deere is the horse-drawn binder that is known for its light draft, good work and ease of handling. Thousands of owners are enthusiastic in their praise of its performance. "I am perfectly satisfied," they'll tell you.

Better oiling facilities, a reel that's easy to lift and shift and an easily-operated bundle carrier make the John Deere unusually easy to handle.

Improved guards and sickle, variable-capacity elevators and an efficient binding unit mean good work in any condition. John Deere high quality materials and workmanship mean longer life, lower upkeep costs.

Be ready for harvest with a John Deere Binder. You'll be through sooner, with less work when either of these is on your farm. See your John Deere dealer. Write to John Deere, Moline, Illinois, and ask for folders HB-636

By R. P. KESTER

THOSE of us who have lived and observed the changes in American life and business during the last twenty-five years have seen revolutionary changes take place that occurred in any one hundred preceding years. Probably no other class of our people has been more affected by these changes in business and social customs than have farmers. Some of the older generation have not taken kindly to the new methods and conditions. They have felt critical and rebellious over the fact that they could not pass the remainder of their lives in the same kind of environment in which they started life.

I am of the opinion that it would have been doing a good turn if the writers and teachers who have been speaking to agricultural people had taken more pains during the past quarter of a century to make clear the processes that have been at work transforming American life; that is, if the writers and speakers understood it themselves. As it was, farmers bumped into the changed conditions without warning with the result we have experienced during the past ten years—over-production in many lines and an unreadiness to supply other things.

As an illustration of this: Twenty years ago there were 18,000,000 acres of farm land in the United States devoted to growing feed for horses. These acres were kept in this line of production too long, or until farmers waked up to realize that 25,000,000 motor vehicles had in a large measure displaced horses and they had an unprofitable market for their horse fodder. The machines got their feed from oil wells.

Cotton raisers and wool producers did not wake up to the fact that the women's styles had changed to such an extent that the bottom was knocked out of the markets of both these commodities. The farmers and sheep raisers kept on with the same acreages and the same sized flocks until low prices jarred them awake, and they realized that silk and rayon had supplanted the old staples in the clothing line.

But it was more than a changing whim in styles that brought about the change. Better houses and warmer homes, to say nothing of closed, comfortable cars for travel, made thinner clothing necessary and the heavier, thicker materials were discarded. The same principle has been at work in the matter of foods. Gone are the days when the average family must fill up on corn, fat pork and plenty of bread in order to keep "the home fires burning" so as to withstand the cold of winter. A summer diet is now sufficient in winter for the reason that we fight the cold in other ways.

Then another cause of the jam in the matter of over-production was because we learned how to produce so much more per man. Machinery and improved methods have more than taken up the slack caused by the millions of people who have left the ranks of food producers and joined the consuming class. The census just being completed, it is said, will show the greatest reduction of the farm population ever tabulated in any census, yet our granaries and cellars are overflowing with food products. When will the danger point be reached in farm desertion? Surely, that day is not yet in sight.

But during all these years of transformation in the habits of the people our agricultural leaders, with few exceptions, have been harping on the same lines of instruction they themselves learned a generation before when conditions were different. Is it possible that with all our education it must yet be said that the human race learns little except through experience? If ever there was need for prophets in the teaching forces it is now, and it has been so for the past twenty years.

Friendly Talks

By Edgar L. Vincent

"I STEPPED on a little piece of ice. It was covered with snow and I fell and broke my arm." So easy to slip.

"I made a misstep going down stairs and fell clear to the bottom. It bruised me up terribly." So easy to slip.

Yes, it is the easiest thing in the world to slip, and the folks of the farm are just as apt to make a mistake that way and lose their balance as anybody in the world.

Just now I met a farmer who is in my opinion missing it the worst way. He has a good farm, a nice wife and some fine boys and girls; but something has happened to him. He has lost his pride. He lets things go around the old farm so that they are always at sixes and sevens. He does not seem to care how he looks when he goes to town. Face rough with a week's beard; trousers tucked into his boot-tops. It makes one feel bad just to look at him.

For that man is surely slipping. Some day he will go down, and I dread to think what a crash there will be. While he may not break a limb or bruise his body, he will lose something more valuable than anything of that kind. He will lose self-respect.

The man who thinks little of himself is in a bad way. It will lead to his losing the respect of his neighbors. Worst of all, his own boys and girls will come to think as meanly of him as he does of himself; and I hold that that is a loss which no man can afford to sustain. Bad enough to go down in the estimation of one's friends and neighbors. It hurts to have the farm run down, but to know that one's own children think little of their father, that is what breaks one's heart.

So it seems to me that every one of us ought to think well of ourselves. We should hold our heads high and feel that we are engaged in the greatest business this world knows, a business without which humanity would sink into nothingness. Let's realize our high station in the sight of God and work hard to maintain it.

Can't Carry a Tune

FORMERLY we had plenty of king birds, wrens, bluejays, robins, barn swallows and many other common varieties. But now you see nothing but starlings, one of the most destructive birds on the farm. They eat the fruit and pull the grain, besides destroying other birds' nests by eating the eggs and young and fighting the other birds. That is the reason we have nothing but starlings, and they can't even carry a tune.

Thin pasture, thin cows, thin profits.

The Lean-Fleshed Months

By E. A. KIRKPATRICK

SOME dairymen are having bad dreams now—as bad as the dream Pharaoh had about the seven lean-fleshed and seven fat-fleshed kine. If Pharaoh were alive today and milking cows for a living he would see the seven fat kine devoured by a smaller number. Five lean cows would do the job, the significance being that the dairy profits of seven months of the year are swallowed up by the losses of the other five.

The five lean-fleshed and ill-favored months that eat up the profits for so many dairymen are the summer months when cows are on grass. They ought to be the best months of the year—for don't cows need grass?

They would be the best months of the year if dairymen only kept on feeding grain through the summer. But many dairymen don't. As soon as the grass is well up, grain is reduced or discontinued entirely. As one progressive dairymen aptly puts it: "They padlock their feed bin and tell the feed dealer they are away for the summer."

Imagine how you would feel if you came in from the field when greens are in season and found no bread, meat or potatoes on the dinner table—only greens. That's the situation the dairy cow is in when grass alone supplies her food. The cow doesn't react to the situation as you would, however. She goes crazy over the first grass of spring, and will refuse hay and grain for a time; and therein lies the danger.

The dairymen is likely to feel, and many of them do feel, that if a cow likes grass so well and then refuses grain when she can get grass, then grass is what she should have. In Pharaoh's time cows could get along very well on grass. Today they can't. That is, not the kind it pays to keep for milk. It's a difference in the cows, not in the grass.

A cow that gives 15 pounds of milk a day can get along on grass alone. Let's see what her daily ration would amount to in a year. If my multiplication table is right, it would be something less than 6,000 pounds of milk a year. You can't skim a great deal of cream off the milk from such cows. They don't make their owners rich, or enable them to have a new car every year.

A cow that gives 40 pounds of milk a day can't eat and digest enough green grass ordinarily to supply all the nutrients she needs. A cow giving 40 pounds of milk a day would have to eat and digest 300 pounds or more of green grass to get all the food required, for there are only ten pounds of dry matter in 100 pounds of green grass. That is a smaller amount than there is in 100 pounds of milk with 15 per cent solids.

When a producer of this ability goes on green grass in spring she may keep up in production for a while. Sometimes she will increase her daily production, but when she

does so she makes the milk out of nutrients from her own body tissue. After the tonic effect of the green grass wears off, milk flow decreases and the cow loses weight.

What is just as important is the fact that after the grass goes along toward maturity it becomes woody and unpalatable, contains less protein and more fiber, and often burns out entirely due to heat and drought. A cow that has gone through the green grass period without grain, and has put some of her own body tissue into the milk pail, is in no shape to get along on the poorer pasture of late summer and fall. If at this stage of the game the dairymen realizes the situation and begins to feed grain, he must not only feed enough to supply the raw materials for milk, but extra grain to build up the cow's body. It is a hard job, bringing back milk flow in late summer, if it is allowed to slip in spring or early summer.

Why do so many dairymen handle the grass situation so mistakenly? For the simple reason they do not consider grass as roughage, which it is. Dairymen who are considered wise feeders would not think for a minute of going ahead with hay alone if grain gave out in winter. Pasture without grain is essentially the same thing. As the grass

loses its succulence it loses its protein. The cow that stays on grass throughout this change is in no different position than the cow that is switched from alfalfa to timothy hay in winter.

Most any cow tester can show you with figures the point I am trying to make by statement of fact. A tester in one of the Pennsylvania associations told me late last fall that the herds which had been fed grain liberally all summer were the ones that held up in milk flow, not only in summer but in fall after the cows were taken off pasture.

Another Pennsylvania tester tells of a herd in his association that produced 9,000 pounds of milk on pasture alone during June and July. The following year, during June and July, grain was fed and the production was 13,000 pounds, with two cows less in the herd. The value of the increase was \$90, the feed cost was \$44. Profit over feed, \$46. "Moreover," he points out, "the cows were in much better shape to start fall and winter production."

A Kansas tester remarks that the cows which get a good grain mixture while on good sweet clover pasture are the ones which are producing the milk. Another says that the ones which have held up in production during the summer are the ones which had grain while on grass, with protein supplements as soon as the grass began to harden.

The same is true in Illinois. One Illinois dairymen whose experience was related to me, increased his returns above feed cost more than 64 per cent by feeding grain on pasture. When grain was fed in addition to pasture, his returns on each \$1 spent for feed jumped to a total of \$3.45 as compared to \$2.10 during the same month of the previous year. Feed cost of one pound of butterfat was reduced from 21 cents to 15 cents, while feed cost of 100 pounds of milk was lowered from \$1.05 to 85 cents.

The value of feeding grain to dairy cows on pasture was brought out clearly in the case of another Illinois dairymen who quit following this practice. During the first month after the change, production of his cows dropped off nearly 15 per cent and the herd lacked \$22 of making as much return above feed cost as it did the previous month.

Minnesota testing association records show that the cows getting grain with pasture produced 68 pounds more butterfat per year than those on grass alone. The grain cost \$7.46 per cow more, but the fat was worth \$27.50 a year. A big feed bill means something when it's hitched on to a good cow.

Pasture is of course very important in the dairy business, in fact all livestock enjoy and profit from eating good grass, but the owner who expects a cow to board herself all summer usually pays the bill in the end.

Grain in summer helped these grades to make 9,994 lbs. of milk, 885 lbs. of fat.

ALASKAN COMPETITION

WE remember the first shipment of reindeer to Alaska. The deer were unloaded for feed and water at the old Pittsburgh stockyards. Now the Alaska herd is estimated at 1,000,000 head, an increase of 600,000 since 1925, and its expansion to 10,000,000 is predicted. Reindeer meat promises to become a real competitor in our markets before the end of another decade.

UNIMPORTANT

A PRESS bulletin of the Ohio Experiment Station refers to "nine pure-bred Jersey heifers, half-sisters, and nine pure-bred Holstein heifers, also half-sisters." What are half-sisters in terms bovine? In discussing turf horses it is customary to apply the term half-sisters to the progeny of one dam by different sires. All of which may be highly unimportant but such things are sometimes interesting.

REASON FOR ROTATION

ACCORDING to Professor M. F. Miller of the University of Missouri the top seven inches of soil on a 3.68 per cent slope will be washed away in forty-nine years if the land is cropped continuously in corn. With a rotation of corn, wheat and clover the same amount of washing will require 320 years. This may be called the erosion reason for crop rotation, but there are many other good reasons.

FOR BUTTER CONSUMPTION

THE emergency campaign to promote the consumption of butter proved so successful that the National Dairy Council has proposed a permanent educational movement for the same purpose. The funds will be provided by regular contributions from all interests, dairymen allowing a deduction of one cent for each can of cream delivered. While the dairymen of this region are not directly concerned in this plan they are vitally concerned in any effort of any part of the industry to promote the consumption of dairy products. The Dairy Council's plan looks good and it should have the support of all branches of the industry.

A MERE OPINION

THERE is plenty of room for difference of opinion about the primary effects of the new tariff bill on agriculture. For it is impossible to determine in advance whether any advantage in higher duties on agricultural

products will or will not be offset by higher duties on other commodities. But some secondary effects of the proposed tariff are already manifest, and they are distinctly unfavorable to agriculture. This legislation is already provoking retaliatory sentiment which affects our industries and labor and thereby our home market for farm products. It threatens to do much more than that. Other countries are not only putting higher tariffs on our agricultural exports but are preparing special trade arrangements to discriminate in favor of each other's commodities and against ours. Great Britain, for example, proposes to sell in Canada what this country now sells; and to buy in Canada what is now bought here. Such an arrangement would be a tremendous blow to our export trade in both manufactured and agricultural products. Viewing both primary and secondary effects, we cannot escape the conclusion that the new tariff bill will result in more harm than good to agriculture.

A CHINESE EXAMPLE

BY reading a Chinese official report, published in English, we learn that Hon. Ko Ching-en, mayor of the city of Tsingtao, has reduced the number of bureaus of administration from nine to five, saving \$300,000 a year in the cost of local government. In our country officials couldn't do such a thing, and maybe wouldn't if they could; but the taxpayers should begin seriously to study possible economies in local government. Our system is both ancient and expensive, and we might improve it and reduce its cost at the same time.

AGAIN THE GENTLE BULL

SUNDAY afternoon, May 18, John Clark of Angelica, Berks county, Pa., went to the pasture to drive his employer's herd bull to the barn. The bull attacked him, tossed him over its back and then tried to gore him as he lay on the ground. He succeeded in getting hold of the ring in the bull's nose and hung on until another employee, George Ehr, came to the rescue. Mr. Clark is in the hospital with severe if not serious injuries. Mr. Ehr's courage in entering the fight and getting control of the bull deserves the highest praise. The part played by the rescuer is the only bright spot in all this dark record of bull tragedies.

A LITTLE BETTER

AFTER a big slump the wool market is showing signs of improvement. At recent Australian and British auctions prices advanced five and ten per cent from the low point. In this country more activity is reported but no important price changes. The market for wool fabrics appears to be stronger. The American Woolen Company, the largest user of wool, recently advanced the price of its cloths and appears to be able to maintain the new level. Fashion also is a little more favorable to the use of wool. While current world supplies are liberal stocks of fine wools are not so large, particularly in this country, and the tendency is away from their production. The consensus of opinion is that the wool market has found bottom, that any change is likely to be for the better, but that there is no reason for excitement.

OLD AND NEW PRODUCTION

YEARS ago, when the production of sundry novelties was being recommended on account of low prices for the usual crops, we called attention to the fact that most farmers must continue to depend on staple products for their income. That is true now as it was then, but there have been some developments which should have full consideration. Back in the nineties, for example, potatoes were a garden or truck-patch crop

in most parts of Pennsylvania. Now potatoes must be rated among our staples and their production will increase as farmers realize the opportunities nearby markets give them. The same thing is true of other things such as common vegetables, tree and small fruits. Last year an acre of land brought a Pennsylvania farmer 750 bushels of carrots which he sold at \$1.25@1.50 per bushel. Every year some farmers tackle the production of something new to them but marketable in this great industrial region. It is a question whether this development is as broad as it should be. Are we too much devoted to the staples of our fathers and too little inclined to take advantage of the opportunities our market situation affords?

ANOTHER FAILURE

THE business world is witnessing the discomfiture of another group of experts who thought they could nullify economic law by a "stabilization" scheme. This time it is copper. We mention this latest fiasco because it is a fine example of the kind of stabilization some alleged economists would inflict on agriculture. Over a year ago the large copper producers decided to cooperate, to restrict production, to hold the price at a profitable figure by orderly marketing. The price of copper got away from them at first, jumping to 24 cents a pound. Even the producers could see that was dangerously high. They voluntarily brought it down to 18 cents and held it there for a whole year. This stabilization plan really worked, it appeared.

But behind the scenes things were happening. Manufacturers of copper products turned to aluminum as a substitute. They bought up and remelted scrap copper, twice as much of it as the year before. The little and the marginal producers started mining at an unheard-of rate. A surplus began to pile up. European money poured into Africa to open new mines there. Naturally the whole scheme collapsed. Within a few days the price dropped from 18 to 12 cents. Now the red metal is moving again near the lower prices. But, long after they have forgotten the cause of their trouble, the cooperators will miss the markets lost to aluminum, to scrap metal and to the over-stimulated African mines. If copper economists are like some others we know they may devise another stabilization scheme to solve this new set of problems.

MAGAZINES AND MILK

THE current issue of one of the women's magazines has an article on undulant fever. This is the disease which humans sometimes contract, presumably from the use of raw milk from cows infected with Bang bacillus disease, otherwise contagious abortion. The article graphically describes the delirious suffering of a child afflicted with undulant fever. He had been drinking raw milk from his grandfather's herd which was accredited but not abortion tested. Other cases are cited along with statistics which would indicate that many unnamed or misnamed illnesses are really undulant fever. The article ends by urging the magazine's millions of readers to use only pasteurized milk while farmers are eradicating Bang bacillus from their herds.

This is the second women's magazine of vast city and town circulation which has published a feature article on this subject recently. Without doubt both have frightened thousands of city housewives. Right or wrong, they are educating milk consumers to make certain demands on milk producers. When distributors and public health authorities start to issue irksome regulations it will do no good to accuse them of tyrannous violation of farmers' rights. They are simply yielding to public pressure. There are more consumers than producers. The majority rules, and it is a buyers' market.

Pennsylvania Farm Comment

By MILES HORST

Federal figures are correct, farm real estate values in Pennsylvania have dropped three points during the past year. They are the lowest they have been since 1914. In this decrease they are in line with those of New Jersey and New York, but slightly more than the decrease of farm real estate values in the country as a whole, which decrease is estimated at one per cent.

M. Reisinger, president of the Pennsylvania Jersey Cattle Club, has called a business meeting of the club at State College, during the Farmers' Week program. Plans for summer activities of the club and the organization exhibit at the 1931 State Farm Show at Harrisburg will be made at the meeting.

WHEN Union county organized its first calf club three years ago with some fifty members, each purchasing a well-bred heifer calf, it laid the foundation for almost as many good dairy herds. Of those heifers in that first club, 27 have finished their first year's milking. Their average production was 9,255 pounds of milk and 314.1 pounds of butterfat, or almost twice the average annual production of the cows in that county. One club heifer owned by Paul Zimmerman came through her first year with 13,332 pounds of milk and 563 pounds of fat. These club members are raising the heifer calves from their original heifers so that within a few years they will be the owners of dairy herds far above the average in their communities.

FIRE, says the U. S. Department of Agriculture, destroys roughly \$100,000,000 worth of farm property each year. In addition to farm property other property in rural communities lost annually by fire is even greater. The two total more than all city property lost in this way even though city property is several times more valuable than rural property. One reason for this heavy loss in rural communities must be attributed to the general lack of organized and planned methods of fire prevention and fire-fighting in the open country. Here and there a township has its own fire-fighting apparatus. More of these are needed. But in addition to the apparatus, water supplies must be considered. The use of fire-proof building materials, arrangement of buildings to prevent spread of fire and a host of other problems enter into the prevention of these immense losses.

TWO important farm events fall on the same dates this year. Farmers' Week at State College opens Tuesday evening, June 17th, and continues through until Thursday evening, June 19th. The Lancaster Fair Cattle Show will be held on June 18th and the following day the cattle will be sold at public auction. Both events will be highly interesting and well worth attending.

OF the 54 outbreaks of hog cholera reported in Maryland since Jan. 1, Dr. Atherton, in charge of cholera control work in that state, attributes 32 to the feeding of infected pork in garbage and kitchen still. As the summer advances, Dr. Atherton estimates that the percentage of infections due to this source will increase, for during the summer and fall hog growers purchase considerable amounts of cured meats which may carry the infection. Cooking all scraps will destroy the infection. Better still keep all pork scraps away from hogs.

RECENTLY a farmer in Franklin county sold a cow to a dealer. Five days later she died. A post mortem revealed that the cow had a number of nails in her stomach. The dealer refused to pay for the cow on the ground that she was not sound at the time of purchase. The case went before a local justice of the peace who decided that the dealer must pay for the cow.

A STUDY of the relation between spray pressure and yields on "400-bushel" acres in this state made by Earl Moffitt brings out the following facts. On acres yielding from 400 to 500 bushels the spray pressure actually used by the growers was an average of 290 pounds; on acres yielding from 500 to 600 bushels the average pressure used was 336 pounds, and on those yielding over 600 bushels the pressure averaged 374 pounds.

This does not necessarily mean that simply because a grower uses a high spray pressure he will get the large yields. But it does point out that spray pressures from 300 to 400 pounds give better results than lower pressures do.

KEYSTONE orchardists will go on their annual tour July 14 to 18, according to an announcement just made by the Pennsylvania State Horticultural Association.

Starting at Allentown the tourists will first visit the H. C. Trexler orchards. The trip will then carry the orchardists through Middletown, New York, over the Bear Mountain Bridge, to Danbury, Connecticut.

The Connecticut tour will be in charge of Professor S. P. Hollister, of the Connecticut Agricultural Experiment Station at Storrs. In Massachusetts W. H. Thies, extension pomologist of the Massachusetts Agricultural College, will take

What Johnny Thinks the Frogs Are Saying

charge of the tour. The Hudson Valley in New York will next be visited with L. C. Anderson, horticulturist of the Hudson River branch of the New York Agricultural Experiment Station, in charge.

THE twelve thousand Mexican quail liberated recently in this state by the Pennsylvania Game Commission will be welcomed on the many farms which they will inhabit this summer. The quail is an insectivorous bird ever on duty to help the farmer in his fight against destructive insects. As such the landowner is continually striving to protect it.

A DAIRY exposition will be staged as the chief feature of this year's annual farmer's field day to be held at the Pennsylvania State College, June 18 and 19. This does not change, however, the regular complete program as carried out in former years. For in addition to the special dairy features, there will be tours to the experimental orchards, gardens, seed and fertilizer plots, and inspection of the college herds and flocks under the guidance of the college teaching and research staffs.

THE book accounts kept by the sixty-eight boys and girls on the baby beehives shown and sold at last winter's Farm Show held at Harrisburg have been averaged by "Jimmie" Keim who had charge of the project. These show that the average steer cost \$88.88. The average feed consumption was 3,448 pounds over a period of 273 days and at a cost of \$74.09. The gain on these steers cost \$16 per hundredweight, compared to \$15.26 a year ago. The average gain per head per day over the feeding period was 1.69 pounds. After deducting all costs

company. We turned her inquiry over to the Pennsylvania Insurance Department and were informed that this particular insurance company was not licensed to do business in this state and that for a number of years the company had not issued a financial statement. The Department's recommendation in this case was to leave "hands off."

Emergency Hay Crops

ON a trip through the northern tier counties one is chiefly impressed, this spring, by the deplorable conditions of the clover fields which should furnish this year's hay crop. Following a dry summer, when growth was poor and short, came a winter when the frost came out in February, with alternate freezing and thawing from then on into April. As a consequence, all the clover, and, stranger still, nearly all the timothy was heaved out and killed on practically all the hill fields.

Some farmers, who realized the situation early, reseeded with clover and timothy in April, sometimes with a light harrowing. With a sufficiently moist season this may furnish a crop of clover in late summer, though a midsummer clipping of the quick growing weeds may be necessary.

Many fields are being plowed shallow, or worked up with a harrow or disk, so as to keep the lime and manure on or near the surface, and seeded back to oats or a mixture of six pecks of oats and two to four pecks of Canadian field peas. The peas will do best when sown early on good moist soil. Inoculation is advisable.

Many questions are coming in regarding cowpeas. Cowpeas are a southern crop and are not advisable in northern Pennsylvania. Soy beans are a much better bet than cowpeas. They make the best emergency hay, almost equal to alfalfa, and are splendid green feed during August when pastures are short. Soy beans should be put in with a grain drill as soon after corn planting as possible, sowing six to eight pecks per acre. They will be killed by the first frost, so to get their full growth should not be sown much after June 15th. The crop should by all means be inoculated.

Soy bean seed is already rather high, \$3 to \$3.50 per bushel. This will influence many to turn to Sudan grass or one of the millets for later seedings. Sudan grass in a warm, dry season makes more hay and somewhat better hay than most of the other millets. The seed is cheap and is usually sown about June 1st at the blossom stage. In wet seasons, however, it is badly affected with rust. Some sow about a bushel of soy beans and ten pounds of Sudan grass. The mixture is cheaper and the hay usually heavier and easier to cure and handle, but of lower protein and poorer quality, than soy beans alone.

The common millets are inferior in feeding value to timothy, but are pretty sure to make a crop. As with timothy, early cutting makes the best quality feed. With no clover hay to conflict this year, timothy should be cut early. By cutting at the blossom stage, or even before, much more palatable and nutritious cow hay may be secured, with but little sacrifice in the size of the crop. All hay in the northern counties is apt to be at a premium this fall, but for dairy feed quality is the important consideration.

J. B. R. Dickey

The Farm Home

Need of a Change

By H. L. ALEXANDER

I HAD been running a public stenographic office near the mountains of West Virginia and wished to spend a vacation at the seashore, hoping it would do me a lot of good, mentally and physically. Not having the money to do this, I talked with some school teachers who had secured positions during the summer months, and they suggested that I try being a waitress in a hotel at some sea-side resort.

So a girl friend and I wrote letters to the Chambers of Commerce in a number of towns along the New Jersey coast. They responded promptly giving us the names of hotels in their particular towns. Many letters were written and one day we received a form of application from a hotel along the seashore in New Jersey asking our name, age, education and the church to which we belong. We filled in the blanks and gave two references. Much to our surprise and pleasure, in about a week we were notified to report for duty the first of July, and get our own uniforms (white dresses with green trimmings) to match the decorations in the dining room.)

There were twelve girls who waited on the tables and one of these girls occupied the room with us. All of them were either going to school or teaching and were well behaved and attractive. Our duties in the dining room required about five hours a day. The people who ran the hotel had been in business for sixteen years and they knew how to treat help and were very nice to us.

The funniest thing about the whole thing was taking tips. It seemed odd at first to have the guests tip us after meals and when they were leaving. However, our feelings were not hurt by this incident.

We went in bathing almost every afternoon. Many of the girls had members of their family come down for a few days or longer. I had the pleasure of my father's visit for one week and we enjoyed very much taking in the movies and bus rides.

We had the same food that the guests had and the change did me a lot of good. I gained five or six pounds in flesh and came back home with more money than I started out with.

Cooking for Two

AFTER preparing meals for a large family one must do a bit of thinking to cook for just two, without waste of energy and food.

In warm weather left-overs do not keep fresh and it seems best to avoid them, so I do not make filling for an entire layer-cake at one time. I bake three layers and cover one with chocolate icing, perhaps, cut it in halves and it becomes a two-layer cake. With another layer I can use maple sugar or cocoanut; the last layer is fine with filling and top of whipped cream with which we prefer a cake that is not too new. In this way we do not tire of a cake before it is gone.

Using one-half or one-third of all materials mentioned in a recipe gives good results if one measures carefully. Mae Smith.

When Strawberries Are Ripe

SIX cups small berries (about two pounds), four pounds selected berries, four pounds sugar, two tablespoons lemon juice. Select ripe, solid fruit, wash well, and cap. Crush and cook the six cups of small berries for five minutes, stirring all the time; strain. This amount of fruit should yield about two cups of juice. To this juice add the sugar and heat slowly, until it is entirely dissolved. Drop the large berries into this sirup and allow the fruit to simmer for three to five minutes. Drain the berries from the sirup and place them carefully about an inch apart on shallow, enamelware pans or china platters.

Preserves Cooked by the Sun

Boil the sirup for about ten minutes to a temperature of 105 degrees C. or until it is thick. Remove the scum, add the lemon juice, and pour the sirup in a thin layer over the berries on the pans or platters. Cover with window glass propped up about a quarter of an inch so as to allow air to circulate over the fruit. Place the pans of preserves in the sun for two or three days, or until the sirup has formed a jelly. After each day's sunning, turn the berries over, and take them into the house before the dew falls.

Without reheating, put the jelled preserves into hot sterilized glasses, cover the top with paraffin, label, and store in a cool, dry place.

This amount yields about one quart of preserves. The success of this method of preserving strawberries depends on the heat of the sun as well as the firm, ripe, condition of the fruit.

A Thought for Memorial Day

By GERTRUDE S. STEWART

IF those valiant dead whose memory is emblazoned on our hearts anew each Memorial Day as we watch the fresh new flags waving in honor to their bravery and sacrifice, if those silent voices could arouse us to avoid the ravages of war, their message would no doubt be one of friendly brotherhood with all nations.

Perhaps we mothers can speak for them in the ideals we instill into the minds and hearts of our children—the youth today who will be the future rulers of our country in the great tomorrow. What our children hear us say, and what they glean from the printed page is of powerful influence.

The Carnegie Foundation for Peace has suggested a list of books for children which will lead them to see good-

ness and beauty in all nationalities. They are books for children to read or for us to read to them. This alcove of delightful stories excites an interest and tender feeling in children from all over the world. Many times our youngsters clamor for something to do or something to read in vacation.

Let us then this summer give our thought to teaching International Love, and provide ourselves and our children with literature fascinating and beautiful in the realm of interest in our little neighbors all over the world. Here is the list with name of author, publisher and price. If you have a county library, you can get the books there. If you wish to buy books, there is no better choice than this splendid group:

| Title and Price | Author | Publisher | Address |
|---|--------------------|-------------------|--------------|
| In Sunny Spain—\$2.00 | K. L. Bates | Dutton Co. | New York |
| Lucha (Mexico)—\$1.00 | Ruth Gaines | Chicago | Chicago |
| Betty in Canada—\$1.00 | Edna G. McDonald | Little Brown | New York |
| Friends of Ours—75c | Elizabeth Colson | Friendship Press | New York |
| George Washington Lincoln Goes Round the World—\$1.50 | | | |
| Kembo (Africa)—60c | | | |
| Ah Fu (China)—60c | | | |
| The Three Camels—60c | | | |
| Midwinter (Sweden)—\$1.75 | E. Barnard | Friendship Press | New York |
| Allice in Jungland (Africa)—\$2.00 | Neville & Wood | Friendship Press | New York |
| The Hunted Pickaninies (Australia)—\$2.25 | E. H. Spriggs | Friendship Press | New York |
| Little Black Eyes (Japan)—\$2.00 | Katharine Adams | Macmillan Co. | New York |
| Nidita (Mexico)—\$2.00 | Mary H. Bradley | Appleton Pub. Co. | New York |
| Jegging Deer (Japan)—\$2.00 | | | |
| Moon's Birthday (China)—\$2.00 | W. M. Fleming | Macmillan Co. | New York |
| Pepi, the Duck (Germany)—\$2.00 | Karlene Kent | Macmillan Co. | New York |
| Dinner that Was Always There (Alaska)—60c | Grace Moon | Macmillan Co. | New York |
| Dog of Flanders (Germany)—75c | Jorothy Rowe | Macmillan Co. | New York |
| Nuremberg Story—75c | Dorothy Rowe | Macmillan Co. | New York |
| Donkey John of Toy Valley—\$1.50 | Rhea Wells | Macmillan Co. | New York |
| Dutch Twins (Holland)—\$1.00 | | | |
| Heidi (Switzerland)—\$1.50 | R. J. Snell | Whitman Book Co. | Chicago |
| Rabbit Lantern (China)—\$1.75 | Ouida | Lippincott | Philadelphia |
| Abdul (Egypt)—\$2.00 | L. F. Perkins | Lippincott | Philadelphia |
| Coco the Goat (Spain)—\$2.00 | Johanna Spyri | Macmillan Co. | New York |
| Little Tomino (France)—\$1.75 | Dorothy Howe | Macmillan Co. | New York |
| Nettette of the Wooden Shoes—\$2.00 | Winthrop B. Palmer | Macmillan Co. | New York |
| Miki (Hungary)—\$2.00 | Rhea Wells | Macmillan Co. | New York |
| | Hill & Maxwell | Macmillan Co. | New York |
| | Esther Braun | Macmillan Co. | New York |
| | Maud & Miska | Macmillan Co. | New York |

Nip Them in the Bud

By MAME O. THOMSON

SOME of our most troublesome weed pests are also delicious "greens." Among these are dandelions, narrow leaf dock, wild mustard and milkweed.

The dandelion and dock have large tap roots but they spread but little from the root system. The milkweed has a rootstock which is responsible for a number of new plants each season, but by far the greater part of the new plants come from the seed which is carried by the wind for great distances, as is the dandelion. Wild mustard depends entirely on seed for propagation. Its seed as well as the dock seed, is chiefly scattered by becoming mixed with the grain and hay crop. It is then sown by man with the grain and grass seed.

It becomes evident that if we are to control these pests, we must prevent their seeding. In other words "nip them in the bud." We can do this and at the same time make them justify their existence by furnishing us with a wholesome food.

The dandelion will be our first problem. With the first sprout of green from Mother Earth's bosom, it will make its appearance. Take your basket and knife and sally forth. Cut just below the whorl of leaves through the fleshy tap root. Wash and clean, place in an agate or aluminum pot large enough to insure a generous supply of water. Add salt liberally and strips of bacon or salt pork. Boil until tender and you have a dish fit for a king, farmer, day laborer or the tired business man.

Next will come the dock. You must remember that only the narrow leaf is edible. There will be no difficulty in distinguishing between the broad leaf and narrow leaf members of the species. As the narrow leaf is very narrow and the broad leaf very broad. It is always well to combine this green with others, either dandelion, milkweed or horseradish, which we can scarcely class as a weed but makes a delicious "green."

The milkweed should be cut when from four to six inches above the ground. These shoots boiled in salt water until tender, drained and spread with butter or served with sauce, are every bit as delicious as the ever popular asparagus tips.

Wild mustard is as delectable as young turnips cooked with their tops on. And if you have not yet had these, you have missed one of the really good things Mother Nature has to offer the fagged appetite.

The secret of cooking and serving "greens" lies in thorough washing, boiling in plenty of salt and water, proper draining and attractive arrangement on dish. Hard-boiled eggs, sliced, make an attractive garnish for all greens. They may also be arranged around a platter of boiled ham or other pork.

All "greens" are rich in vitamins A and B, so necessary for growth in children and health in grown-ups. Serve them at least twice a week through the season and "kill two birds with one stone." Rid your farm of weeds and your medicine cabinet of "spring tonics" and "cathartics."

Cooking Peas

FOR those of us who can gather four peas fresh from the garden the cooking of the pods and using the water for cooking the peas will bring a surprise. Use only perfect pods and gather as soon as they are well filled. Half-ripe peas have less vitamin value than green peas. Wash pods well, boil 20 minutes and drain through a colander, pressing the pods well. Pour the water from the pods over the shelled peas and cook slowly from forty minutes to an hour. Dress in the usual way with plenty of butter and with or without thickening, as desired. Delicious. Hepsy Neff.

To keep the natural bright color of the fruit in preserves, rapid cooking is necessary.

How Shall We Save?

No. 6802.—Misses' dress. Sizes 16, 18 and 20 years. An 18-year size requires 3½ yards of 39-inch material. Price 15c or two for 25c.

No. 6803.—Sizes 16, 18 and 20 years. The dress with the cape for an 18-year size requires 4½ yards of 39-inch material. Without the cape 3½ yards will be required. For a how-to-illustrated 1-3 yard of material 39 inches wide cut crosswise is required. Price 15c or two for 25c.

No. 6829.—Sizes 4, 6, 8 and 10 years. An 8-year size with sleeves requires 3 yards of 39-inch material. Price 15c or two for 25c.

No. 6818.—Sizes 1, 2, 3, 4 and 5 years. A 4-year size requires 1½ yards of material 32 inches wide. Price 15c or two for 25c.

No. 6800.—Sizes 34, 36, 38, 40 and 42 inches bust measure. A 38-inch size requires 4½ yards of 39-inch material. Price 15c or two for 25c.

No. 6805.—Sizes 34, 36, 38, 40 and 42 inches bust measure. A 38-inch size requires 3½ yards of material 32 inches wide. Price 15c or two for 25c.

No. 6836.—Girls' undergarment. Cut in six sizes: 2, 4, 6, 8, 10 and 12 years. A 10-year size requires 1½ yards of 36-inch material. To trim neck and armhole edges as illustrated will require 2½ yards of lace or edging. Price 15c or two for 25c.

No. 6830.—Ladies' apron. Cut in four sizes: Small, 34-36; medium, 36-40; large, 40-44; extra large, 44-48 inches bust measure. To make the apron for a medium size will require 2½ yards of 36-inch material. To trim with bias binding as illustrated requires 4½ yards. Price 15c or two for 25c.

No. 6821.—Cut in four sizes: Small, 34-36; medium, 36-40; large, 42-44; extra large, 44-48 inches bust measure. A medium size requires 2½ yards of material 36 inches wide or wider. To trim as illustrated will require 6½ yards of lace or edging. Price 15c or two for 25c.

No. 6821.—Cut in four sizes: Small, 34-36; medium, 36-40; large, 42-44; extra large, 44-48 inches bust measure. A medium size requires 2½ yards of material 36 inches wide or wider. To trim as illustrated will require 6½ yards of lace or edging. Price 15c or two for 25c.

No. 6821.—Cut in four sizes: Small, 34-36; medium, 36-40; large, 42-44; extra large, 44-48 inches bust measure. A medium size requires 2½ yards of material 36 inches wide or wider. To trim as illustrated will require 6½ yards of lace or edging. Price 15c or two for 25c.

No. 6821.—Cut in four sizes: Small, 34-36; medium, 36-40; large, 42-44; extra large, 44-48 inches bust measure. A medium size requires 2½ yards of material 36 inches wide or wider. To trim as illustrated will require 6½ yards of lace or edging. Price 15c or two for 25c.

No. 6821.—Cut in four sizes: Small, 34-36; medium, 36-40; large, 42-44; extra large, 44-48 inches bust measure. A medium size requires 2½ yards of material 36 inches wide or wider. To trim as illustrated will require 6½ yards of lace or edging. Price 15c or two for 25c.

No. 6821.—Cut in four sizes: Small, 34-36; medium, 36-40; large, 42-44; extra large, 44-48 inches bust measure. A medium size requires 2½ yards of material 36 inches wide or wider. To trim as illustrated will require 6½ yards of lace or edging. Price 15c or two for 25c.

No. 6821.—Cut in four sizes: Small, 34-36; medium, 36-40; large, 42-44; extra large, 44-48 inches bust measure. A medium size requires 2½ yards of material 36 inches wide or wider. To trim as illustrated will require 6½ yards of lace or edging. Price 15c or two for 25c.

Curing the Blues

SOME folks complain about the deadly monotony of their jobs—but on close inspection we find that other jobs, too, have a good proportion of routine. Granting this fact, it looks reasonable that the dullness might be relieved if one only used a bit of thought.

Housework, for instance, goes along better if our clothes are comfortable, clean and good-looking. Why do houseworkers wear dull, drab, shrunken garments when materials are so cheap and dyes in most of them will withstand many washings.

Being physically at ease does not relieve some sorts of boredom, as one girl found out. She used to buy something new, a dress, or some shoes, or even a scarf, when life began to look too blue. Such a plan might be indulged by any of us, if we didn't get the disease too often or if our tastes kept within our income. Otherwise the remedy might be worse than the disease.

Another, and I think a wiser, way to overcome that dull feeling is to do something different, if nothing more than using a different chair or room. Trying a new dish at every meal, or even once a day, may not entail much extra time or money but it surely ought to add zest to the plain task of providing the daily three squares.

Acquire the Habit

These days when radio and magazines bring such tempting suggestions, I fail to see how any cook can help experimenting. Often we can improve on other folks' recipes—though it may not be proper to boast too loudly.

Paint and lacquer, cretonne and scrim are pioneers in brightening one's view. Painting is recreation to me.

Perhaps George Eliot (or somebody else) was right in saying discontent comes from absence of aim. Certainly it does perk us up to see our progress, even along trivial lines. Do we use our opportunity to add to our material possessions, or widen our mental outlook, or deepen our innermost perceptions as we pass along from year to year? How about acquiring a happiness habit this summer? Vida M. Bates.

Drop Cookies

One-half cup sugar, three-fourths cup fat, one-fourth cup sweet milk, one teaspoon cloves, two cups flour, two cups oatmeal or graham flour, one-half cup molasses, two eggs, two teaspoons cinnamon, one teaspoon soda, one cup raisins.

Blend sugar and eggs—add melted fat—then alternately add the milk and flour, into which you have measured and sifted the soda and spices. Drop by teaspoon onto baking sheet and bake in moderate oven 380 degrees.

Graham Cookies

One cup wheat bran, one cup brown sugar, one-half cup sweet milk, two tablespoons butter (or lard), one egg, one-half teaspoon salt, one cup white flour, one-half cup graham flour, one-fourth cup molasses, two teaspoons baking powder.

Drop the mixed batter from a teaspoon onto a well-greased baking sheet. One-half hour in a hot oven. They are just fine. G. S. S.

Shades or pull curtains of material which light does not penetrate easily will keep out the light and make the room more restful.

Save all worn-out innertubes and tires. Besides using the innertubes for rubber bands they make both excellent kindling for soft coal or wood fires.

Overcrowding the refrigerator cuts down its efficiency. Air must circulate freely if the proper temperature is maintained.

GOOD HOUSEKEEPING FRUIT JAR RINGS

Loop your forefingers thru a Good Housekeeping Ring—twist it—stretch it—do it again! Then see it snap back to a perfect circle.

Here's a Ring that will keep your fruit and vegetables fresh and savory for years. No mould—no "flat sour."

Good Housekeeping Jar Rings are extra-thick, limber rubber, preventing "spurts" from ruining your work at the last minute. For hot or cold pack. Won't harden, crack or curl. Boiling can't make them spongy.

Truck Crops

By G. S. WATTS

IF there are spots in the truck patch where the soil is thin, where spinach, onions, lettuce and so forth do not show a rich, uniform green color, time and money will be profitably invested in top-dressing with nitrate of soda. If the soil is not sour sulphate of ammonia may be used.

YEAR by year we have been picking stones from our truck land, often in the face of promises that the frost would bring up as many more each year. Yet the fact remains that two pieces which were thoroughly cleaned up both before and after plowing five years ago continue to be practically stone free.

Then we formerly had many small boulders just at the top of the subsoil. Broken plow points were a considerable item. The annoyance and loss of time was even more considerable. But the tractor operator carried green switches and stuck one into the soil as a flag wherever he hit a bad rock. The removal of these has been rewarded with a record of but one broken plow point since early last fall. This spring the safety release on the plow has not operated once.

TO force the full strength of newly set strawberry plants into runner production clip blossom clusters off at once.

Lima Beans

Could you give me any information in regard to planting hush Lima beans? Are they planted by machinery or by hand?

Which method for applying fertilizer is better, by drilling or by sowing in the row?
J. Kenneth Long,
Carroll county, Md.

BUSH Lima beans usually are planted by hand, but a satisfactory job may be secured with most garden seed drills when careful adjustments are made.

If the amount of fertilizer to be used is limited it probably will give the greatest return if used in the row. But care should be exercised to avoid direct contact with the seed. To mix with soil a hoe may be drawn through hand-made rows after the fertilizer has been scattered along. Machines should not drop the fertilizer directly on the seed or the seed directly on the fertilizer. The ideal place for the fertilizer is "at the sides and below" the seed.

Heavy applications, 500 or more pounds per acre, usually are broadcast and worked in before planting.
G. S. W.

The Story of Woodbine

(Continued from page 3.)

a right to deduct this amount from the note or if the plaintiff sold a diseased cow to the defendant he would have a right to deduct the value of the cow from the note, but I submit that the proof is that the cow in question was not only in good condition but on account of the remarkable gain she made she must have been very healthy." In due time the Court rendered a verdict for the plaintiff. Mr. Smith promptly carried this case also to the higher Court.

By this time I was very tired of lawing and regretted to see Mr. Smith waste his money. He was really a good man but "hot-headed." I finally sought an interview with him and said: "I will beat you in every Court to which you carry these cases, but I have no desire at all to harass you or to see you throw your money away. I am going to make this proposition. If you will pay me the two debts and pay your part of the costs, I will pay mine and we will quit." To this proposition he said, "I would not give you a nickel to compromise."

Both cases were tried in the Circuit Court. In the hog case Mr. Smith

went on the stand and told his story. The judge instructed the jury to find for the plaintiff. It took only a short time to try the cow case, but again the court confirmed the findings of the lower court.

The original debt was \$42 for the three hogs and \$35 for the cow, or \$77 for both, but it cost Mr. Smith about \$300 before he got through. Mr. Smith has long since passed to his reward, but I have always been glad that even after I had him down and victory was perched on my banner I offered to compromise with him and pay my share of the costs. Even to this day there are men in Elkins who call me Lawyer Zinn every time they meet me.

THE MARKET PLACE

By W. R. WHITACRE

"WHAT is green asparagus?" writes a New Jersey reader. "My asparagus is green, but I don't get as high prices as are in the papers."

I believe that hundreds of farmers in this section do not know what the consumer wants when he asks for "green asparagus." Not one farmer in ten produces the kind that brings top prices.

Green asparagus is green from the tip to the bottom of the stalk. Marketing studies have shown that the price varies with the amount of green color and each inch of white lowers the price.

Blanched or white asparagus is popular in some sections of the country and is produced by keeping the rows hilled with loose earth. The stalks are cut just as the tips break through the surface and it is used chiefly for canning. Green asparagus is not hilled and is cut above the surface of the ground.

When the stalk first comes through the ground the head or tip is solid and compact. As the stalks grow the head swells and finally spreads. The difficulty appears to be in growing thick stalks of good length before the heads spread. There do not seem to be many growers who can produce this strictly green stock. There is a difference in varieties and strains and some will make green stock better than others. Asparagus needs to grow quickly to be of best quality, and heavy applications of fertilizer are needed in most cases.

Yield per Acre

The yield per acre of green asparagus is lighter than that of white, but the price averages considerably higher. Asparagus tapers as it grows and the diameter of stalks cut well below the surface runs considerably larger than when cut above the ground.

Pennsylvania growers in the southeastern part of the state grow this green asparagus and throughout the season they get top prices in Philadelphia and New York. Few New Jersey growers produce the kind of green grass that is wanted, but this season there is a larger percentage of it among the receipts from Maryland and Delaware.

This last week I have been going around the market daily and have been keeping a record of sales. I have found that two growers, one from New Jersey and the other from Pennsylvania, have received \$3.60 per dozen bunches for their largest size grass. This was strictly long green. Other good growers have been averaging around \$3 per dozen bunches and the only difference between this and the \$3.60 stock is two to four inches of white at the base.

If readers of the Market Place want information on selling asparagus I will try to answer letters addressed to me in care of the Pennsylvania Farmer or promptly.

Lazy Days ahead — get the Wake-up food now!

Quick New Energy

No more blue Mondays at Our house

"Wash day holds no terrors for me now. In fact, I look forward to it," writes a farmer's wife.

Imagine, a woman anxious to do the family wash! But let her tell why:

"When Fred (my husband) brought home a new shiny power washer on my birthday, he chased away blue Monday. Now it's fun to do the washing. My clothes are cleaner, whiter and I find they wear longer because I don't have to rub to get out the dirt.

"But that's only half the story. I got more than a scientific machine—far more than a tub, a motor and wringer. I got freedom! Out of that washer also comes extra hours

for recreation, sewing, visiting; relief from back-breaking toil at the scrub board; even a better disposition.

"Now, I have time to do things and go places. I don't have to spend half the week resting up from wash day. My washer saves my time and strength. Fred says I'm a different woman. I wish all

farm women had a machine like mine."

What about it men? Is your wife's time worth anything—can you match her health and happiness for the comparatively few dollars it takes to get a power washer? Think of the machines **you** have that lessen your own work. Give your wife a break. Invest in a new power washer. She may say you can't afford it but after she has used the machine for a week's wash, she'll wonder why you didn't get one before.

But be sure to get a **good** washer—one you can depend on. That is the only kind advertised in this paper.

ONLY RELIABLE WASHING MACHINES
ARE ADVERTISED IN THIS PAPER

The Man You Buy From IS FULLY AS IMPORTANT AS THE USED CAR YOU BUY

Many motorists, seeking high quality as well as low price, *prefer* to buy fine, powerful used cars.

The main point to remember is to buy your car from a reliable merchant—the local Buick-Marquette Dealer.

There are tremendous values in used cars—greater values today than there have been in years—and your Buick-Marquette Dealer will gladly assist you in making your selection.

Go to him for your used car, just as you'd consult any leading professional man in your community, knowing that his good name is a definite assurance of satisfaction.

You'll find that he has an unusually wide selection of used Buicks and other makes

as a result of the remarkable demand for new Buicks and Marquettes.

You'll find that the Buick-Marquette Dealer conditions his cars carefully—prices them fairly—and offers them on the most reasonable terms.

You'll find that he is an expert in transportation, giving maximum value, whether you wish to pay \$200 or \$2000.

The man you buy from is fully as important as the used car you buy. Real satisfaction awaits you at your Buick-Marquette Dealer's. See him—*today!*

TIRES · TUBES · BATTERIES · BRAKE LINING

Copyright, 1930 The Firestone Tire & Rubber Co.

JUST as the U. S. Department of Agriculture has developed the strains in crops that give you the greatest yield per acre, so has Firestone developed Gum-Dipped Tires that give you the greatest tire mileage and endurance known.

For example, Firestone pioneered the Balloon Tire, which today contributes so much to motoring comfort and economy . . . Firestone originated and patented the exclusive Firestone process of dipping cords in rubber gum, which saturates every fibre of the cord, minimizing heat and friction and doubling the flexing life of the cords . . . Firestone was the first to put a non-skid tread on tires and today gives you the toughest, longest-lasting, safety tread made. Through constantly pioneering new and better methods of tire building, Firestone has added thousands of extra miles to tires without extra cost to the user.

Firestone Gum-Dipped Tires have broken all world records for results in safety, economy, endurance and mileage.

Demand this extra mileage in the tires for your car and truck. See the Firestone Tire Dealer in your community. He will save you money and serve you better.

PENNSYLVANIA FARMER

(761) 17

Orchard Windfalls

By S. W. FLETCHER

A GROUP of prominent apple growers met with the Federal Farm Board in Washington on May 14, at the invitation of the Board, to consider apple marketing problems. These men were selected from all the most important apple districts of the country.

Pennsylvania was represented by Chester J. Tyson, of Gardners, New Jersey by Lester Collins, of Moores-town; West Virginia by D. Gold Miller, of Gerrardstown; Virginia by Harry F. Byrd, of Winchester, and C. Purcell McCue, of Greenwood; New York by Paul Judson, of Kinderhook, and M. C. Burritt, of Hilton.

This is "not an advisory committee, as provided for in the Agricultural Marketing Act, but rather a general committee to work with the Farm Board in the development of a national program for cooperative effort among apple growers."

Each man was asked to report the present status of and the outlook for cooperative marketing of apples in his district. The Pennsylvania member reported that most of the apple growing in his state is for local markets, hence there is very little opportunity for cooperative marketing; but that, in the wholesale districts, there are several apparently successful local cooperatives, and there have been as many more that have failed. In his opinion, there may be room for a number of other local cooperatives in the near future, but the possibility of effecting a regional organization in Pennsylvania is quite remote.

The New Jersey representative reported the failure of the central sales organization in that state, and the Western New York representative related a similar experience.

There was no sentiment whatever for the federation of local cooperatives into a regional sales agency, in the East, however successful this may have been in the West.

The Committee was asked by the Farm Board to make concrete suggestions as to how the Board might aid apple growers in the marketing of their product. The blunt reply of one committeeman, "By leaving us alone," seemed to reflect the majority opinion of those present. The Committee expressed itself as against the organization of a national master cooperative for apples, as has been provided for certain other commodities; as favorable to the regional organization of cooperatives only after a thorough investigation indicates that there are a sufficient number of locals to justify it; and as favorable to the organization of local cooperatives only when they develop out of the needs and by the initiative of the growers themselves. The Committee urged that more attention be given to standardization of grades and to the encouragement of better grading and packing.

This counsel may not be wholly acceptable to the Federal Farm Board, but it is common sense, and undoubtedly it reflects the judgment of a majority of apple growers.

Massachusetts Deer Law

Massachusetts has the best deer law in the United States, from the point of view of the fruit grower and farmer, and in all equity. In most states, including Pennsylvania, the pressure exerted on the legislature by sportsmen has not made it possible for the fruit grower to kill deer that damage his trees unless he actually sees them nipping or rubbing the trees. Since deer work mostly at night, this is practically impossible.

The Massachusetts law authorizes the fruit grower to shoot deer that are damaging trees, or that are about to damage trees. This gives him sufficient leeway to protect his property. Some Pennsylvania fruit growers have secured permission from game wardens to kill deer on their property at

any time, but the law itself does not authorize this.

The Massachusetts law goes further; it compensates the fruit growers for damage caused by the state's livestock. The damage is assessed by a committee. The owner of the orchard selects one member of the Committee, the State Game Commission another and the County Commissioners the third. A more or less standardized procedure, or schedule of rates, has been devised; the grower is allowed so much per tree of a certain age and variety, and a certain degree of injury, whether bark rub, limb split, nipping, etc. The compensation money is derived from license fees.

Is not this the next step in Pennsylvania?

Apple Blossom Festivals

These innocent diversions now are being staged all over the country except in the Northeastern states. The nearest one is at Winchester, Virginia. They are good publicity for the apple industry, which needs all the advertising it can get. They develop sympathetic understanding between the fruit growers of a district and their trading center. They also promote cooperation among the growers. It is reported that 300,000 people saw the Shenandoah Apple Festival at Winchester. It takes a good deal of work and some money to stage one of these festivals, but it is worth while.

No other industry has a more natural or more attractive means of publicity. But fruit trees are fully as attractive when laden with ripening fruit as when in blossom; it would be equally desirable to stage an Apple Harvest Festival in the fall, (that is, in years and in places where there actually is a harvest to gloat over.)

Why not have Apple Blossom Festivals and Apple Harvest Festivals in Pennsylvania? In a state so largely devoted to local market fruit growing there are special reasons for promoting this desirable contact of town and country—the reason of self-interest, if no other. It is not necessary to have as ambitious an affair as the one at Winchester. In our state, smaller local displays would be more practicable, to include only the natural trading district. The fruit growers and Chambers of Commerce of Reading, West Chester, Lancaster, York, Gettysburg, Chambersburg, Allentown, Wilkes-Barre, Erie, New Castle and Pittsburgh, and other centers of fruit growing, should consider this means of increasing the demand for "home-grown fruit."

Thinning

It now seems likely that many Pennsylvania apple growers will need to thin their fruit in order to get a grade that will command a premium. In the experience of Professor F. H. Beach, of Ohio, who kept records for several years, this costs two to seven and one-half cents per bushel of harvested fruit, with an average cost of three and one-half cents. But the fruit has to be picked anyhow, so it is hardly fair to charge all this expense against the cost of thinning. Dr. J. R. Magness has recently reported on experiments in Washington and Virginia which indicate that about 50 healthy leaves are required to produce one large fruit of Delicious, 30 for Winesap and 25 for Jonathan. The food material that makes the apple grow is manufactured in the leaf and seldom is transported much more than 20 inches from the leaf. Hence the importance of having an abundant and healthy leaf surface near the fruit, and a reasonable ratio between the number of leaves and the number of fruits. With summer apples, it is not wise to wait until after the June drop before beginning to thin, if the apparent set of fruit is heavy; with winter varieties, thinning may be deferred until after the June drop.

Pyrox Pays Better than Home-Mixed Sprays, Grower Says

IN comparative tests, hundreds of successful growers have proved that Pyrox is not only easier and safer to use than messy home-made bordeaux mixtures—but is also cheaper. Pyrox-protected potatoes pay extra cash from extra yields of better quality.

The experience of Mr. C. S. Newcomer of Chambersburg, Pa., is typical of the results obtained by Pyrox users. He writes:

"This season I made a test comparing Pyrox with home-made bordeaux. Seed, fertilization, cultivation and soil conditions were the same. However, my yield on Pyrox-sprayed plots was 385 bushels per acre, an increase of 70 bushels over the plots sprayed with home-made bordeaux which yielded only 315 bushels per acre.

"Pyrox is easy to use—I need but a few minutes to put the material in the spray tank and I am ready to spray. There is no nozzle trouble. Pyrox stays on the vines through hardest rains, and goes farther. Because of its soft, smooth, creamy fineness Pyrox will go through small holes in the nozzle disc resulting in greater ease in developing and maintaining pressure.

"My Pyrox-sprayed potatoes will show, at \$1.00 a bushel, at least \$70.00 more per acre. They are more uniform in size, smoother and cleaner in appearance than those sprayed with home-made bordeaux."—C. S. NEWCOMER.

**Gets 15¢ to 20¢ per bu.
Above Market Price**

Mr. H. C. Rineard, of York, Pa., writes:

"I raise large acreages of corn, potatoes, wheat and hay so I must make all my labor count. That is one reason why I like Pyrox—because of its ease of preparation and application

Mr. C. S. Newcomer
of Chambersburg, Pa.

as compared with home-made bordeaux.

"This is my second year using Pyrox and I certainly find that it gives me the control of insects and disease on my potatoes, and also improves the quality. I have been getting an increase of 100 bushels per acre, and an average of 15 to 20 cents per bushel better than the prevailing shipping price for my Pyrox-sprayed potatoes."—H. C. RINEARD & SON—November 6, 1929.

At \$1 a bu., Mr. Rineard's extra profit obtained with Pyrox amounted to \$100 per acre! And this is in addition to the extra price obtained per bushel.

Pyrox kills bugs, controls blights, and other diseases, and stimulates plant growth. It is quick and easy to use. Sprays in a fine mist—does not clog nozzles. Sticks like paint to plants, even through severe storms. Now lower priced than in 31 years.

Write us for facts which prove that you can actually cut your production costs—get more profit from your potatoes—by spraying with Pyrox. Please mention your potato acreage.

BOWKER CHEMICAL COMPANY
419 Fourth Ave., New York, N. Y.

THE YOUNG PEOPLE

The Boy Scout Cavalry

"COME on fellows, let's get started on our sixty-mile hike," shouted Bill Mackey, of the Jackson Heights Boy Scout Troop, a red-headed little fellow who, like a hummingbird, never was satisfied to remain in one spot long enough for mosquitoes to scent him as a victim.

Sixty-mile hike? you ask in amazement. Surely no one in this day of automobiles and rapid transportation would start out on a sixty-mile hike.

Ah, no wonder your astonishment; I haven't told you, but the Jackson Heights troop is a mounted organization! One of the few, if not the only one of its kind in the country.

"Hey Paul, hold this bucking bronco till I get on, will you, or he might start for the barn without asking my permission."

"Is that bedding roll of mine still holding?"

"George, see if the bridle on Molly is twisted in front."

"Everybo-o-ody ready? Twe-e-e-t!" and under the leadership of their scoutmaster, Rev. C. C. Pearce, pastor of the Jackson Heights Methodist Episcopal Church, Tippecanoe county, Indiana, twenty-one healthy and vigorous leaders of the coming generation galloped away for three pleasant days close to the bosom of Mother Nature.

This novel troop of boys was organized three years ago when Rev. Pearce arrived in the country community to organize three weak, struggling country churches into one strong institution.

To the Rescue

Then arose the problem of arranging a program which would hold the boys from twelve to eighteen years of age in close contact with the church. The Boy Scouts of America was called to the rescue, and a troop organized. With the cooperation of the fathers it was arranged so that each youth had a horse available for field trips and hikes. Sixteen boys formed the charter group, which founded this novel method of scouting, and the membership has increased until the troop now is made up of thirty-two bright-eyed, quick-minded youths from nearby farms.

Each spring the boys spend three or four days on a sixty-mile hike, and during the summer a two weeks' camp is held along a nearby stream. It is on these trips that many merit badges are won, and the boys have an opportunity to study the secrets of nature, woodcraft, first aid, swimming and other merit badge requirements.

This fireplace in the Scout room of the church was built by the boys.

quirements gained only in heart-to-heart living with nature.

However, these hikes are not the only study hours scheduled for the members of the troop. Through the donation of \$1,000 by Thomas Miller, a farmer in the community, a room in the new church has been outfitted by the boys and converted into their scout headquarters. Twice a month during the long winter months the boys assemble before the huge fire-

Members of the mounted Boy Scout Troop.

place for meetings, study and recreational activities.

The fireplace was constructed by the boys and each piece of material embedded in the structure has a particular meaning of its own. The main part of the fireplace is constructed from geodes, limestone formations, which have been brought 107 miles. The large rock in the center, below the mantel, represents the scoutmaster and those on either side are his assistants. The thirty-two stones surrounding these center geodes are markers for the thirty-two scouts in the troop at the present time, while the sixteen geodes above the mantel represent the charter members of the troop.

Happy Memories

The geod just under the center of the mantel, which has the features of a man weathered into its surface, is a memorial to Thomas Miller who made possible the scout headquarters. Small pieces of mirror embedded in the mortar remind the boys of the many happy days they have spent on the shores of nearby lakes, small rugged stones call to mind the many hills and valleys traversed, and large brightly colored marbles stand for the many games participated in by the scouts. Twelve stones form the hearth of the fireplace and these keep the twelve Scout Laws before the boys at all times.

The light fixtures, with the scout emblem cut in them, were made by the scouts as also were totem poles and many other emblems of decorative and instructive value which adorn the room.

One of the requirements for membership in the troop is that the scout must attend one church service each Sunday. A scout is true to his word and a scout is loyal; thus, these scouts are loyal to the church which provides them with their scout room, and to their scoutmaster, Rev. Pearce.

C. P. Allen.

Try These On Your Friends

What letter is good to drink? T. What two letters name a written exercise? S-A.

What two letters name a vine? I-V. What three letters do you use when you play hide and seek? I-C-U.

What four letters name a title of a governor or ruler? X-L-N-C.

As round as a cup, as deep as a

cup, yet the whole lake of Michigan couldn't fill it up. A coffee strainer. What's a thing without an end? A bowl.

When may a train pass over you and never hurt you? When you are under a bridge.

What town fits in a bottle? Coric. (Ireland.)

National Greetings

THE equivalent national greetings of some other countries to the English "How do you do?" are interesting. Translated they are:

French—How do you carry yourself?

German—How do you find yourself?

Swedish—How can you?

Dutch—How do you fare?

Italian—How do you stand?

Spanish—Go with God, señor.

Russian—How do you live on?

Egyptian—How do you perspire?

Polish—How do you have yourself?

Arabian—Thank God, how are you?

Persian—May thy shadow never grow less.

Your Last Chance

MAY 31st, you know, is the last day to receive contributions on our contests. In case you missed seeing the other notices, here they are again:—

Cartoons—1. The Kicking Cow. 2. The Baky Mule.

Letters on—1. Who Would You Rather Be? 2. My most Exciting Adventure.

All cartoons must be on plain, unruled paper; using India or black ink. Be sure to give your name and address. Letters should be written in ink.

Many readers are sending a contribution for each contest. You may do that too. There will be three prizes for each contest.

Hurry your letter to Young People's Editor, Pennsylvania Farmer, 7301 Penn Avenue, Pittsburgh, Pa.

MEMORIAL DAY

DO you know why loyal boys and girls, the thirtieth of May, March through the streets of every town with flags and banners gay? In their hands they carry flowers fresh, and all together meet To sing, "My Country, 'Tis of Thee," in voices clear and sweet. Then they hear men tell of soldiers brave who boldly marched away. To save our land when danger came, and duty's call obey. So the children come to honor them upon Memorial Day. And bring their flowers with loving hands on soldiers' graves to lay. We think of those who gave their lives and say this earnest prayer, "Dear Father, fill all hearts with love which brings peace everywhere." —Louise M. Ogilvie.

Little Folks' Corner

Prize-Winning Poems

Mother Hen and her ducklings called forth many poems. Three members of one family sent in poems and we start the list with them.

From George Council, age seven.—
When you read our poems
We know you will snicker.
But we'll all be poets,
Just wait till we're bigger.

Dorothy Council, age eleven, says—
Oh, Mother Hen, be careful
Your neck don't break in two;
For if harm should come to you
What would your babies do?

The other member of the family, Mabel, is thirteen. She writes—
The mother hen is careful
With all her babies dear,
Why shouldn't she be fearful
When she knows that danger's near.

Now for the others—
Here's Mrs. Hen with her babies dear,
She can't understand why they act so queer.
She just stands there and clucks and chucks
How can she know that they're little ducks?

Poor old hen
Don't you fret;
Little ducks won't melt
If they get wet.

"Oh, dear! I'm sure you will be drowned,
I never saw such tricks!"
"Please, Ma'am," said they, "I think we're ducks."
"I don't believe we're chicks."

"Babies! Babies! Come out of there
You'll get wet and then beware!"
"But, Mother dear, it's such a treat
For little ducks to get wet feet."

—Ethel Coale.
—Mildred Craner.
—Sarah A. Stoltzfus.

Emma Hartman

Ruth Hartman

With a frightened stare the hen stood there,
Calling her darlings away;
But they kept right on toward the old mill-pond.

"Quack, quack! It's fun," they say,
Martha Palminter.

Mother Hen, that wise old bird,
Gives the message you've always heard:
"Don't wet your feet or you'll be ill."
But restless feet just can't stay still.

—Ruth Levine.

The old barred hen stands fretting on the brink,
Poor old soul just doesn't know what to think!

Her twenty foster chicks have taken to the water
And every single chick has forgotten what was taught her.

—Louise Kilmer.

A chicken always stays on land
And never goes near the water.
Now aren't you sorry for Mother Hen
With ducks as sons and daughters?

—Ruth Elinor Smith.

1. Chicago, Ill.—An interesting view of a Pelican and a young wild duck—the largest and smallest water birds in Lincoln Park.

2. New York City.—Photo shows, left to right, the New York Daily News building, the Chanin, and the great Chrysler, tallest structure in the world. This shot was made from Tudor City looking west.

3. World's finest planetarium opened in Chicago. Photo shows, left to right, Prof.

Phillip Fox, Joseph A. Beuttas, builder, Ernest Grunsfeld, Jr., designer, and Max Adler, the donor, in front of the huge projector. It throws points of light on a huge ceiling and makes them move exactly as the stars in the heavens.

4. "Queen of the Seas" from the air.—Unusual view of the U. S. S. Leviathan steaming into New York harbor. The shot was made from the Los Angeles.

5. Cardington, Eng. Photo shows, in the foreground, Britain's dirigible pride, the R-100, lashed to the mooring mast, while spectators rush out to greet the Graf Zeppelin, the first Zep to fly over England since the War.

6. One of the feature attractions at the Outdoor Life Show, held in Chicago recently, was a bear cub, as timid as a kitten and liking milk about as well. The little cub is shown at feeding time.

Farmer's Business Letter

CROP conditions continue generally favorable. Business conditions show no improvement so far as statistics of production and trade go. However, a better feeling in regard to business is apparently settling in. This is important if it is true, and if it continues. Current trade as well as plans for the future depend on confidence, and once it is restored business gains are certain. To this extent the outlook is better.

Grain Trade

Grain markets showed a trend to the strong side this week, but at the close were largely lost. The better feeling was based on increased demand for North American wheat, and evidence that the world carry-over would not be as large as expected.

On the other side, liberal stocks on this continent stand in the way of the development of a very strong upward trend. But bearing prices is regarded as risky business, in view of the ever-present threat of Farm Board support to check price declines. United States exports of wheat and flour for the crop season to May 1 total 130,795,000 bushels compared with 136,619,000 a year ago. A liberal supply of corn on farms, together with marketing up to current demand, holds the corn market in check.

The Millers' National Federation meeting in Chicago this week went on record as opposed to the proposal that the United States return to a purely domestic basis of wheat production. In a resolution the Federation pointed out that wheat consumption in the United States is now nearly 90,000,000 bushels less per annum than in pre-war years and urged the Farm Board to consider the propriety of "engaging in a nationwide campaign to increase the consumption of wheat and wheat products in the country."

Expanding Grain Program

The intention of the Farm Board to expand its operations in handling this season's wheat crop is indicated in the purchase of two large grain corporations for its subsidiaries. Title to the Hall-Baker Grain Company at Kansas City, with branches in the Southwest, has passed to the Farmers' National Grain Corporation, for a consideration reported to be \$3,000,000.

The Hall-Baker outfit was a private grain marketing agency of the highest standing and operating on a very large scale, having export connections. This purchase confirms the announced intent of the Farm Board to enter the export field.

In addition, the W. C. Mitchell Company, of Minneapolis, Duluth, Great Falls, Mont., and Spokane, Wash., has been purchased for the Farm Board's Northwest selling agency, the cooperative Farmers' Northwest Grain Corporation.

Another step was taken toward perfecting the Farm Board's grain marketing organization when the Omaha Grain Exchange admitted to membership the Farmers' West Central Cooperative of Omaha and the Equity Exchange Grain Company of Kansas City, two of the board's subsidiaries.

These developments add to the significance of the Farm Board's grain marketing program, and strengthen its

position as the dominant factor in grain trade at this time.

Cattle Gain

The cattle market showed substantial improvement this week, with the supply at leading points about in line with recent weeks. Chicago had 43,000 head against 40,000 last week and 42,000 the same week last year. Average price of steers advanced to \$11.50, a gain of half a dollar over last week, which was the low point so far this year.

The cattle market is now 50 to 75 cents higher than at the opening of last week, that gain holding good on all kinds, heavy steers, light steers, common steers and butcher stock. Top steers brought \$14.35 this week against \$14.50 last week, and top yearlings sold at \$13.75. Bulk of steers are selling at \$10.50 to \$12.50.

Stock cattle moving to the country are lighter in weight than a year ago, and are costing \$2 to \$2.50 a cwt. less. And there is some indication that the tendency is to market before cattle are finished in order to avoid a heavier loss should prices continue to decline.

The records show a decided drop in

the percentage of choice to prime steers in receipts, some decrease even in the percentage of good steers, and a marked increase in the percentage of medium and common steers. This, of course, means less beef and poorer beef, and may mean that future supplies will not be as large as estimates have been running. This is the one bright spot in a cattle market otherwise featured by weakness. Some in the trade expect to see the bulk of steer sales work \$2 lower, while others believe that the market will hold fairly well except for some further decline on the lower end as grass begins to show in the quality of the beef.

Hogs Steady

The hog market shows a trend neither up nor down. Losses one day are likely to be made up the next, the contrary being likewise true. For a long time average prices have been maintained at a little above \$10—a good price as prices go these days. Average price of hogs for the week at \$10.05 was the same as last week and only 75 cents below a year ago.

Eleven markets had 484,000 hogs this week against 490,000 last week, 538,000 the same week last year and 600,000 two years ago. Marketing at these points so far this year is over half a million head under last year.

May receipts of hogs will be among the smallest on record for a month. These continued light run and convincing packers that they need look for much expansion in market and thus lending strength to the look.

Receipts at eleven points so far this month are only about 40,000 head or less than for the same date in April. For the past five years May receipts have shown an average increase of 100,000 over April receipts. Only four in the past twenty years have receipts been smaller than April receipts.

Practically all the trading in the future market was confined to the September option. Light hogs for September delivery sold at \$10.20 and medium weights at the same price. These prices being about the same as last week's transactions. The early part of the week at the mainder of this month sold at \$10.20 but as the week progressed prices were obtainable at a somewhat lower figure.

Advance in Lambs

A striking feature of the lamb market is the falling off in the marketing of California springers. It is estimated now that the eastward movement of California will be about 25 per cent short of what it was last year, that much under expectations. The reason is the drought of last year resulting in a much larger proportion of lambs too small and thin for market. This is showing up in the market.

So far Chicago has had only 100 lambs from California against 1,000 on the same date last year. Thus there has been a spurt in prices, which may prove to be only temporary. Lamb prices irregular with offerings showing 65 to 85 cents this week, while sheep were a gain of \$1.15 to \$1.25.

Western states are reporting a lamb crop, Montana estimates run around 90 per cent. Practically all lambs have been contracted. Sheep wool has been sold, at a range of 24 to 24 1/2 cents, around 40 per cent less than was received last year. On consignment wool to the Farm Board's agency is reported as slow divided.

Low By-Products

One factor in the live stock situation is the low by-product market. It is off a third or more as compared one and two years ago, and wool prices are 70 to 80 per cent lower. The prices are about a third below the level of the past two or three years, and grasses show approximately the same decline.

The price of a hide per pound is a little above the price of a steer pound, where normally hides sell at twice as high as good steers, and war time hides were three times high. Low by-product markets have worked against meats showing a full decline in livestock prices.

FEED MARKET

The following quotations are for feed and nearby shipment May 26, according to the U. S. Bureau of Agriculture. They show the approximate cost of feed per ton (all in 100-lb. bags and grain per bushel in carlots and draft basis delivered on track at Philadelphia and Scranton rate points): Bran, \$32.50 to \$35; standard middling, \$32.50; flour middlings, \$35; cotton meal, 43 per cent, \$18.50; gluten \$37.50; No. 2 white oats, \$4; No. 1 low corn, \$9c.

Philadelphia Produce Review

The Philadelphia egg market opened fractionally higher on account of comparatively light receipts and a demand. Prices were fairly well maintained on good quality stock but very lots showed heat defects and very yolks. As a result receivers were slow to move this class of goods at close to cost. Buyers were very close to quality and restricted to buying to immediate requirements. The pressure to sell and the light lower prices. The market on eggs held steady but the volume of goods moved was light. Lack of confidence and buying support still held. Production is being maintained and the into storage movement active. Storage packed stock was offered and the early part of the week at \$2.20 but as the week progressed prices were obtainable at a somewhat lower figure.

The New York egg market opened steady to firm but was unsettled during the middle of the week and closed somewhat easier. Mixed colors and average run of eggs averaged about the quarter to one cent lower but the top grades were fairly well maintained. Late in the week nearby white eggs were quoted at 25¢ per dozen, nearby browns at 24¢ per dozen, and mixed colors at 20¢ to 27¢.

Poultry

Receipts of live broilers were liberal throughout the week on the New York market. The demand was fair and prices irregular with offerings showing wide range in quality. Colored fowls were quoted at 26¢ to 28¢ per pound, Leghorns at 26¢, broilers at 22¢ to 45¢. Squabs at 40¢ per pair. Fresh dressed poultry from nearby markets were light but the demand was slow. Nearby broilers sold at 40¢ per pound and the best squabs at 45¢.

The asparagus market in Philadelphia was irregular. Early in the week supplies were heavy and prices dropped sharply. Later receipts were somewhat lighter and a better demand developed, especially for long green spears. Late in the week Pennsylvania and New Jersey very large stock sold at \$2.25 to 2.75 per dozen bunches with strictly green stock bringing \$3 to \$3.50. Large stock sold at \$1.50 to \$2, medium at \$1.50 to \$1.75 and small at 75¢ to \$1.

Strawberries

Truck receipts of strawberries from Eastern shore sections were very liberal during the week and on several days the market dropped sharply. Late in the week the quality of the berries showed some improvement and this along with lighter receipts caused prices to advance. There was a great difference between the late and early morning market and in some cases early sales were as much as \$2 per bushel higher on the same quality berries as those sold later.

The peak of the season for early berries from Virginia has passed and the berries from that section were of poorer quality than those from Delaware and Virginia. The berries that are bringing top prices are generally from the Chesapeake. Missionaries and Heddins did not generally sell as high as the others. Pennsylvania and New Jersey spinach growers had a disappointing week since the demand for spinach was very light and supplies accumulated from day to day. Some stock carried over was finally hauled home by the growers and other lots sold as low as 10¢ a bushel. Dealers believe that the market will improve somewhat this week unless receipts are too heavy. Late in the week good spinach was scarce and brought \$3 to 40¢ a bushel.

Wool Market

Boston, May 23.—The wool market has been decidedly more active than for several weeks and the demand for American wools has been advanced 10 to 20¢. Territory wools were slightly stronger with the range of prices unchanged. Asking prices have been advanced 10 to 20¢ a pound in the grease on South American cross-breeds. Some sales have been closed at prices one cent higher than quoted during the previous week. Inquiries have been received on Australian merino wools but bids all fell short of asking prices.

active at the same range of prices as during the previous week. Demand for 56s was very dull. Strictly combing 48s, 50s Territory wools were slightly stronger with the range of prices unchanged. GUERNSEY AVERAGE \$15
At the annual Guernsey sale held at Hinsdale, Ill., recently 84 head averaged \$15.

The offering contained many very choice-bred cattle. Top on bulls \$22,000, paid by Radisson Farm of Minnesota. The 15 bulls sold averaged \$391.50. The top female was a mature cow which sold for \$4,200 to Emmadine Farm of Hopeville, N. J., owned by J. C. Penney, Chauncey McCormick of Chicago paid \$3,650 for a mature cow. The 69 females listed averaged \$785. The entries came from 40 prominent herds in the annual meeting of the club held at Chicago selected Robert Scoville, New York merchant, president of the Club for his 12th term.

A NEW BOOK
Henley's Twentieth Century Book of Ten Thousand Recipes, Formulas and Processes is, as its name indicates, a collection of trade and professional. It tells what to use and how to mix the ingredients of formulas for about everything imaginable. The book contains 800 pages and may be obtained direct from the publisher, The Norman W. Henley Publishing Co., 2 West 45th St., New York, N. Y. The price is \$1.

LIVESTOCK

PITTSBURGH

Cattle

Thirty carloads made up the supply of cattle at the Pittsburgh market on Monday of this week. The market opened active and strong to unevenly higher, but after some of the better kinds of steers were sold most trading was done at prices about steady with last week. One load of choice 1,185-lb. steers brought \$12.15 and a load of very good cattle averaging around 1,250 lbs. brought \$12.15. Average quality of receipts was fairly fair and the bulk of steers and yearlings went at \$10 to \$12. Several loads of good butcher steers weighing around 1,100 lbs. sold at \$11.75, while a few very good heavy beefs, mostly heifers, brought \$11.75. Heavy heifers were not numerous and sold at a range of \$7 to \$10, according to quality. Choice fat cows brought \$8.25 to \$8.50; fair to good ones \$6.50 to \$7.50. A few choice heavy butchers brought \$9.50 to \$10.50, medium kind \$8.50 and good heavy bulls \$8.25 to \$8.50.

Prime fat steers, 1,200 lbs. or over 11.75 to \$12.25. Good to choice, do. 11.25 to \$11.75. Fair to good, do. 10.50 to \$11.25. Plain heavy steers, 1,100 to 1,200 lbs. 10.00 to \$11.00. Light Yorkers, 125-150 lbs. 10.00 to \$11.00. Pig, 90-110 lbs. 8.50 to 9.00. Roughs 8.50 to 9.00. Stags 5.00 to 7.00.

Sheep and Lambs

Receipts amounted to about ten carloads. The market was a half dollar higher on clipped lambs, the bulk selling at \$10 to \$10.50. Other classes were generally steady. Spring lambs sold at \$11 to \$12 and a few choice short aged wethers at \$5.

Clipped

Good to best wethers 5.50 to 6.00. Good mixed 5.00 to 5.50. Fair to good, do. 4.00 to 5.00. Common to fair 3.00 to 3.75. Inferior sheep 2.00 to 3.00. Good to best lambs 10.00 to 10.50. Mixed lots 8.50 to 9.00. Culls and common 5.00 to 7.75. Spring lambs 9.00 to 13.00.

Calves

With 1,600 calves on sale the market was steady. Good to choice vealers brought \$11 to \$12; heavy and thin calves \$5 to \$9.

LANCASTER

Cattle

Lancaster, May 26.—Cattle receipts totaled 375 head. The market was slow. Steers and yearlings were weak to 25¢ lower. Early top was \$11.65 on cattle weighing 1,340 lbs. Best yearlings brought \$11.70. Bulk of steers went at \$10 to \$10.75. Bulls were weak, as stock steady, stockers and feeders nominal.

Good to choice calves 11.25 to 13.00. Medium 9.50 to 11.25. Culls and common 7.50 to 9.50.

Hogs
About 425 hogs were on sale. The market was fairly steady with top hogs selling at \$11.75. Heavy weights, 250-350 lbs., \$11.00 to \$11.50. Medium weights, 200-250 lbs., \$10.50 to \$11.00. Light weights, 150-200 lbs., \$10.00 to \$10.50. Packing sows (rough and smooth) \$8.00 to \$11.00.

CHICAGO

Cattle

Chicago, May 25.—Receipts were 21,000 head. Best kinds steady; others a quarter lower. Common to fair steers \$7.75 to 9.75. Fair to prime yearlings \$9.75 to 11.25. Fair to prime corn-fed \$9.00 to 11.25. Cows \$6.25 to 9.75. Heifers \$7.50 to 11.85. Bulls \$6.25 to 9.75. Calves \$9.00 to 13.00. Stockers \$8.25 to 10.75. Feeders \$7.75 to 10.75. Stocker and feeder cows \$7.50 to 8.50. Stocker and feeder cows \$7.50 to 8.50.

Hogs

Fifty-five thousand head, including 25,000 "directs," made up the supply of hogs. The market was steady to a time lower. Top pigs \$10.35; bulk \$9.50 to \$10.30. Underweights, 140-160 lbs., \$9.75 to \$10.30. Light, 160-180 lbs., \$10.00 to \$10.30. Medium butchers, 180-220 lbs., \$10.15 to \$10.30. Heavy butchers, 220-250 lbs., \$10.00 to \$10.30. Heavy butcher, 260 lbs. up, \$9.00 to \$10.25. Stags, 70 lbs. dock, \$8.75 to 9.65.

Sheep

Ten thousand sheep and lambs were offered. The market was 25¢ higher with top at \$10.50. Spring lambs sold up to \$12.50. Native lambs \$6.75 to \$10.25. Western lambs \$8.00 to \$10.50. Spring lambs \$8.00 to \$10.50. Feeding lambs \$5.00 to 7.50. Wethers \$5.00 to 7.50. Yearlings \$6.50 to 9.00. Ewes \$4.00 to 5.00.

CHICAGO CASH GRAIN

Chicago, Ill., May 26.—The following cash prices ruled here today: No. 2 hard wheat, \$1.07; No. 2 yellow corn, 79¢ to 80¢; No. 2 white corn, 82¢; No. 2 mixed corn, 79¢; No. 2 white oats, 41¢ to 41½¢.

Farm Conditions

Frederick Co., Northern Md.
May 13: Weather has been hot and dry, but little sign of rain. Grass and grain looking good, but need rain. Oats also looking good. Some farmers doing planting. Some are waiting for rain. Ground plowed early has plenty of moisture to bring corn up. Fruit injured some by the cold snap the latter part of April.
Roy J. Wivell.

Tioga Co., Northern Pa.
May 17: We have had very nice weather for the past month. Much warmer than usual at this season, cloudy with showers the past few days. Most oats sowed. Farmers getting ready to plant corn. New seedling poor and much of it being plowed up. Early potatoes and garden being planted. Sheep being sheared, wool very low. Some buyers offering 20¢. Hens laying well, eggs 23¢. Best calves \$5, butter 43¢. Young pigs sold at \$5. Mrs. F. W. Lawton.

Lehigh Co., Eastern Pa.

May 13: Very dry weather for a number of weeks. Mountains north of Lehigh county on fire at different places. Farmers anxiously waiting for rain. Most plowing is done. Potatoes are nearly all planted. Corn planting is going on. In some places trees flowered very nicely, while other places the trees had very little flowers. Rye and wheat looking fairly well but very short. Grass fields far behind on account of drought. Old potatoes about all marketed.
Geo. J. Ross.

Wood Co., Western W. Va.

May 17: We haven't had a good rain for several weeks. Pastures short. Meadows poor. The corn-root worm seems to be causing considerable trouble. Much of the fruit was killed by a freeze that occurred the latter part of April. Some lumbering is being done. The county court has planned to gravel several dirt roads this summer.
Allyn Deem.

Lancaster Co., S. E. Pa.

May 18: After about a week extremely hot and dry it is cool, down to 50 at night. Very little rain fell during April and May so far. Ground that was not taken care of right after plowing is rough and dry. Corn is mostly planted; some up. Garden vegetables late, some not coming up, too dry. Cherry (sweet) blossoms frozen. All fruit had nice bloom. Grass fields and wheat good stand. Potatoes scarce. Tobacco not all sold.
C. R. E.

Franklin Co., Southern Pa.

May 12: Hot and dry recently. Ground is hard and some corn to plant yet. Oats up but not growing fast. Pastures scanty and flies have commenced to pest the stock. A series of forest fires in the county recently caused some damage and in some instances stopped traffic. A large acreage of potatoes is scheduled to be planted this season. Potatoes are in good demand at \$2 a bushel.
John B. Shank.

Go On the

PENNSYLVANIA FARMER Tour

ON THESE GREAT RAILROADS

The New York
Central Lines
Great Northern Ry.
Missouri Pacific
R. R.
Burlington
Northern Pacific

HERE is your finest opportunity to enjoy at minimum expense, and under the most favorable conditions, two weeks of joyous travel to and through the great Glacier National Park, the Pacific Northwest, Yellowstone National Park and the Colorado Rockies. It's the pleasure trip of a lifetime—a vacation treat your entire family will never forget.

This marvelous tour is offered you through the cooperation of the Pennsylvania Farmer and five of America's greatest railroads at a cost lower than you ever dreamed such a trip could be made. And it takes place July 26 to August 10—just when it will be easiest for you to get away.

It's a wonderful educational sight-seeing tour. From Philadelphia, Pittsburgh and other convenient stops as you travel to Buffalo where all tour members meet to go on to Chicago and St. Paul. Into Glacier National Park and the Indian Reservations. Then on to Vancouver, B. C., and by steamer to Victoria and Seattle. Thence on to Longview, Portland. On the return you see the world-famous Yellowstone National Park and the beautiful Colorado Rockies; Denver, Colorado Springs, etc. Then across the great wheat growing state of Kansas, on to Kansas City, St. Louis and later home.

One Low Cost
Pays All!

You Travel
with Friends.

You can almost leave your pocketbook at home! The entire cost is covered by one lump sum which includes rail and Pullman fares, motor and boat fares, meals in dining cars and hotels, lodging, sight-seeing and national park tours. No tickets to buy, no tips to pay, no hotel or baggage worries. MAIL COUPON now!

You'll be with jolly, congenial folks just like yourself on this wonderful tour. Friends and neighbors right from your own county and state are planning to go. Get together with people you know—talk it over and plan to go this year. Remember the tour starts July 26. Mail the coupon below today!

Nimble, quick power —where it's needed

NIMBLE on hills—in tight places—in mud, loose soil or sand—with a "Caterpillar" Tractor. You go close around trees—right into corners—able to till all the land—kill all the weeds.

For you command positive track-type traction and the easiest, quickest, most responsive steering principle known. The "Caterpillar" Tractor steers through separate clutches of its easy-rolling tracks! A light pull on one steering lever—convenient to the comfortable, deep-cushioned seat—disengages one steering clutch. The other, still engaged, turns you quickly—under full power. You work close—protect your trees—with a "Caterpillar."

You get more work done better and cheaper. That's why so many shrewd orchardists own "Caterpillar" track-type Tractors.

Prices—f. o. b. Peoria, Illinois
TEN . . . \$1100 TWENTY . . . \$1900
FIFTEEN . . . \$1450 THIRTY . . . \$2375

Farm Facts and Fancies

By ALVA AGEE

DR. I. T. LEONARD, bacteriologist of the federal Bureau of Soils, writes: "In your column, Farm Facts and Fancies, I note what you say in regard to the regulation of the sale of legume inoculants. Possibly you are unaware of the work that has been and is being carried on in this connection by the New Jersey and Wisconsin Experiment Stations and the U. S. Department of Agriculture. The Department endeavors to test samples of practically all brands of soil and seed inoculants made in the United States whether produced privately or by institutions. As a result of this annual inspection a list is prepared bearing the names of the firms whose samples of materials have been found satisfactory."

I am glad that our readers may know more of the advisory service now being rendered, and the federal Bureau's list of firms whose samples have been found satisfactory should be consulted by them until better protection is afforded. However, the author of the Geneva bulletin that I quoted was urging the matter of "adequate control" within its own state, and that would mean the barring from market of goods that were not dependable. He recognizes the fact that such a list as the federal government prepares does not give the needed protection.

In every state the department of agriculture or experiment station should ask its state to direct it to test all legume inoculants and to drive out of the market any that were not as represented. The farmers need this protection, and under it the use of inoculants would increase, and to the farmers' profit.

Potato Enemies

The bug that is doing the most harm to the potato today is harbored by our writers on health. A housewife who tries to provide her family with the right sort of a diet said the other day: "Nobody has a good word to say about the potato in the diets that are prescribed. It is either condemned or not mentioned."

An Irishman might not be able to pass a domestic science examination, but he knows that the potato gives strength to do hard work. It furnishes good fuel for muscular activity. I play roque with a retired physician who has much hard sense. He says that the Lord made no mistake in the provision of food products, and that the human body, in normal condition, is equipped with power to make any needed adjustments when the scientist's balanced ration is not used by an ordinary mortal.

There is a lot of propaganda favoring a certain fruit or vegetable that is financed by producers' associations, and I do not think much of such methods of getting an undue share of the consumer's money. It is addition in one place and subtraction in another, and no enlargement of the market. The gain in one direction is a loss in another, and agriculture stands still.

"Relief" for the Eastern Farmer

Some of our eastern farmers are asking where they come in so far as the plans of the Federal Farm Board are concerned. The country stays hopeful that those who join commodity associations, as producers specializing in wheat and cotton can do, will benefit, but the diversified production of eastern farmers would not let the most of them fit into the scheme easily. So far they have been by-standers while the great experiment in price control is being made, and their problems must wait.

I don't see anything particularly out of the way about this, because the Board certainly should make its first attempts where conditions are most favorable to some degree of success. The plans now being formed for ap-

ples and potatoes may affect eastern farming in some degree. Anyhow the eastern farmer is getting about as much out of this governmental effort as the wheat and cotton grower is getting so far.

Tariff and the Farmer

The tariff has ceased to be a political party question and one may discuss it as safely as he would the weather. We are told that if the benefits of a protective tariff policy can not be conferred upon agriculture as they are on manufacturing, the next course would be to withdraw the benefits from manufacturing so that the farmers could buy their supplies more cheaply, and thus all of us would be on the same level.

This suggestion comes to mind as one sees the effect on demand for and prices of some of our products that the present business recession has produced. We are peculiarly dependent on full employment of labor in our industries. When demand for it slackens, food prices tend to slump.

We may not like the protective tariff system at all, but the present business depression certainly would be rated as too slight for comparison with the situation if the system were abandoned. The theorists may differ about the outcome in the long run but I am thinking of the jolt for a considerable term of years that would come to farmers when demand fell off because labor was unemployed. I reckon the suggestion is made chiefly to give manufacturers something to think about when opposing farm relief measures.

Improving Permanent Pastures

The Wisconsin Experiment Station estimates that it is quite possible for a herd of twenty cows during thirty grazing seasons to remove nearly six tons of phosphoric acid from the soil. It says: "The amounts of available phosphorus present usually indicate the producing capacity of the soil." Of course old pastures that are not satisfactorily productive usually need much more than phosphorus, but we do well to place phosphorus at the head of the list. Along with this need is that of lime.

The Wisconsin tests show the profitability of use of a complete fertilizer, and of reseeding with grass and legumes. Readers who hold back on account of the expense of full treatment should try an application of lime and superphosphate, and they should plan to broadcast some clover and sweet clover seed early next spring. Try this on a few acres.

A Letter from Delaware

AS I sit on the porch with a lazy bee buzzing here and there and all of God's great out-of-doors so inviting, I feel that it is too bad that every one cannot live in the country in spring and summer (especially children). The wood in front of me is beautiful, with the different shades of green and the dogwood blooms here and there. This makes one feel that we are not nearly thankful enough for all of these blessings.

I enjoy Mr. Kester's articles very much. I think the little personal touches make us feel better acquainted, and I cannot see how any one could object to hearing about those interesting grandchildren.

I am very fond of children. We have two boys, aged five and nineteen. Our only girl of six was accidentally killed by an auto four years ago near our home, where she was gathering daisies by the roadside. We rented the farm and bought our present home on a spur road, where there is not so much traffic, and our tenants lost a boy of eight a few weeks ago, while returning from a neighboring farm.

Sussex county, Delaware.

Excuses

AN excuse is a manufactured alibi, though we pretend that its purpose is to explain why we acted or failed to act in the matter; thus when we wish to explain we give a reason, but when we wish to conceal we give an excuse, for that reason an excuse has only one purpose, that is to hide the facts about our actions.

It is a notable fact that we do not offer excuses for our virtues, but for our failures. For that reason the facts that we wish to conceal by our excuses as a rule are the failures we make, thus the offering of an excuse is, as a rule, an acknowledgement of our failures.

It seems to me that it will not be out of place to recount some of the excuses offered for the condition that many of the farms are in today, because they are as numerous as the briars and elders that infest the fence row.

From the time when Aaron melted the gold of the Israelites and made the golden calf, and when called to account for his actions by Moses tried to cover up his folly with an excuse, to this day, excuses are as numberless as the scrub animals on the farm.

Signs of Alibis

As you travel over the country and view the unproductive condition that many farms are in, you can rest assured that the owner has on hand a supply of excuses, with spread enough to cover up all the erosions and washes, plus the filth that has not been cut for years.

It is interesting to listen to the excuses offered by the owner for the condition of the farm—the unsightly appearance, caused by the neglect to take pride in the appearance that the farm presents to the public.

The sad fact that confronts every one who is engaged in agriculture and offers an excuse for the condition that his farm is in, is that he is headed toward financial ruin, and all the excuses he can offer will not check his progress, but will accelerate its speed.

If some of us would spend more time in a study of the needs of the farm, and less time in thinking up excuses, the harvest would be more bountiful—the appearance to the many people passing through the farm would be more pleasing, and the enjoyment the home folks would get would make life on the farm more substantial.

Weak Arguments

The excuses offered by many farmers for not having a rotation of crops in which a legume has possession at least one-third of the time, and a heavy sod to plow down every third or fourth year, to reinforce the fertility of the land, are as weak as the producing power of the land on this farm.

The excuses offered for neglecting the proper care of the manure which the land needs to assist it in building a heavy sod are as numerous as the fleas on a mangy dog. The excuses offered for not giving better care to the livestock in the way of shelter and a better grade of roughage during the winter are as cold and lifeless as some of the animals are at the close of winter.

The excuses offered for lack of pride in the general appearance of the farm and the home are as feeble as some of the crops harvested on the farm. The excuses for not having membership in the Farm Bureau, not cooperating in the shipping of livestock or consigning wool in the wool pool, are as groundless as the age-old theories in regard to the moon and the signs of the Zodiac.

The excuses for not taking an interest in the community in helping to make it one of the best in the county are so weak and flimsy that they have no comparison. John D. McReynolds, Harrison county, W. Va.

Any farm wife will be a better wife with the NEW MAYTAG

For homes with electricity, the Maytag is available with electric motor.

THE CHURN AND THE MEAT GRINDER ATTACHMENTS . . .

THE Maytag aluminum churn sets over the center post in the washer tub, and enables you to churn the butter with the same power that washes the clothes. The Meat Grinder Attachment sets over the power leg and takes the hard work out of grinding meats, nuts, fruit and vegetables. Grinds at the rate of two pounds a minute. The churn and meat grinder attachments are extra equipment furnished at reasonable cost.

A Week's Washing Free

Write or phone the nearest dealer for a trial home washing with the NEW Maytag. If it doesn't sell itself, don't keep it. Divided payments you'll never miss.

There Is Only One Sure Control For All Fungus Diseases—BORDEAUX

THERE may be differences of opinion among the authorities as to the best insecticide, but one and all, agree that Bordeaux Mixture is the one and only effective fungicide. And—they also agree that to be fully effective it must be used when freshly mixed—Therefore home mixing, is the surest means of insuring its effectiveness. The new "Instant" method takes all of the hard work out of preparing Bordeaux Mixture.

And the use of

Nichols Triangle Brand Copper Sulphate

insures its strength and purity.

Write for free new booklet containing directions for preparing "Instant" Bordeaux.

That is why each year more dairymen feed Larro with pasture. Right now you can make more money too doing the same thing.

One of the leading candidates on the Republican ticket was the most prominent defender of the old high tariff policy in the United States. His defeat, especially since he was a candidate in Pennsylvania, shows that there has been a change of sentiment on this subject in recent years. In time past Pennsylvania and the New England states wrote the high tariff law because of their dominance in the manufacturing field. Since the World War the world seems to have shrunk and nations now trade back and forth across the backyard fence. For this reason the "Nationalist" and the "Isolationist" is not so popular as he used to be.

The convention was to convene at one-thirty in the afternoon, but I was

Friendly Talks

And the time to begin caring when we are young. Grow up the way, then it will not be so hard breaking ourselves in when we are older. Cultivate the habit of seeing what the needs of others and of giving them a good, big, wholehearted gift when it will count for most. The more we intended to give but did not give, only the shadow of a belated wish, never comes to pass.

When Water Lights the Home

By R. U. BLASINGAME

Most of us are familiar with the turbine and the overshoot wheel, but it is only recently that a manufacturer, who specializes in equipment for small streams, has started the building of impulse wheels, which makes them available for the small stream at a moderate price. The impulse wheel consists of an iron frame or wheel mounted on a horizontal shaft with cups or buckets attached to the rim. Water under pressure issuing from a jet strikes the cups and causes the wheel to rotate.

Charges Battery

Nothing has been said about prices, because each installation varies widely according to conditions and requirements for power. In general, a water power installation will cost more than a gas engine driven plant of the same capacity, but the water power plant, if properly installed with new equipment, will last practically a lifetime with almost no cost of upkeep.

The installation

of a water power plant is not difficult. Bulletins dealing comprehensively with stream measurement and the selection of equipment can be obtained from the United States Department of Agriculture, as well as from water wheel manufacturers. Before purchasing any equipment it may be well to investigate the reputation of the manufacturer and visit several of his nearby installations.

of our first state entomologists was Professor Smith, of whom it is said that he had been able to tame some of his pets to such an extent that they would eat out of his hand, or any other part of his body, and who died bravely in the last ditch he was filling in.

A Fatal Error

There was a rumor that he tried to infuse more kindness in the species by crossing an inoffensive honey bee queen with a ferocious Jack mosquito. The result does not seem to have justified expectations—it was said the hybrid product had stings on both ends.

Since it is only the female of the species that needs a blood diet, to reproduce life, it surely is encouraging to see that they—I mean the lady mosquitoes—have discovered a balanced ration with the protein of a vegetable. If they can sustain life and propagate the species on a synthetic substitute containing enough hemoglobin and vitamins, or whatever blood consists of, we may yet hope to see swarms of mosquitoes gentle as doves, fanning the heated brows of tourists from California and Florida, when they visit our seacoast, or at night sing them bed-time lullabys of the state which if it must yield the first place in mass production of asparagus to California, yet is proved to own the best domesticated mosquito in the Union. Felix Zernin.

Burlington County, N. J.

Mosquitoes

I READ in a recent issue of the Pennsylvania Farmer an article under "Legumes and Malaria" stating that a Russian physician has observed how the anopheles mosquito seems to prefer a diet of legumes.

It is most appropriate that a discovery so valuable to humanity should have been made in Russia. In a country that abhors the shedding of human blood so much it surely is fit that every drop be preserved.

Of course I, being a Jersey man, take more interest in our state bird—the Mosquito. We have been trying to civilize him for more than fifty years. One

Above is a small direct-connected, turbo-generator outfit suitable for small streams having fairly high heads. This unit takes up a space of 24 by 18 inches and is fed by a five-inch pipe. Under a 35-foot fall it will supply electric current to operate 25 to 30 lamps at a time of 40 watts capacity each. No storage batteries are required and the speed and voltages are automatically controlled.

Left.—This shows a 30-inch, low-head-turbine operating under a head of only six feet and supplying 125 to 150 lights of 40-watt capacity. Several of these plants have been installed on Chickies' Creek, Lancaster Co.

Bottom.—Paul G. Sellers of Chester county, Pa., has installed a wheel six feet in diameter and two and a quarter feet wide to transform the energy of a small stream into light for his poultry plant, barn and farm home. The stream which does this work is about two inches deep and 18 inches wide where it flows over the dam.

FARM LABOR

APPARENTLY there is no shortage of farm labor. This year has brought us more letters from men who want work than from farmers who want help. We have several applications now for positions on farms.

NATIONAL GRANGE

GRANGERS in this territory will find the annual meeting of the National Grange convenient to attend this year, for it will be held at Rochester, N. Y., Nov. 12-21. The location is within driving distance of a majority of our readers, and there will be a large attendance from nearby states. This is the sixty-fourth session of the organization and will probably be the biggest on record. A class of 12,000 is expected to take the highest degree in the Order.

TIME TO BUY

NO one knows whether farm real estate values have hit the bottom, but it is pretty certain that the decline has been checked. In 1920, the high point, the average value of farm real estate was 170 per cent. compared with before-the-war figures. During the next five years it fell off about 8 per cent. a year, but during the last three years it has declined only one per cent. a year, and now rests at 115, according to government report. Some states showed a small increase last year. These figures support the contention of many far-sighted farmers that now is a better time to buy than to sell farm lands.

BACKYARD COMPETITION

THERE has been a noticeable decrease in consumption of farm products during the present era of unemployment. Vegetable growers and poultrymen want to know if market demand will fall off still more this summer as the unemployed attempt to grow their own food and have some left to sell. Undoubtedly competition may be expected from new back yard gardeners and temporary farmers. But it can hardly be an important factor in the city markets. The high degree of skill being developed by vegetable and egg producers is their best protection against this and every other kind of competition.

A PROFIT FOR EVERYBODY

THE representative of the livestock industry on the Federal Farm Board is evidently an optimist. In a recent address he said, in discussing the lamb business: "We do have overproduction, but I believe we should unite, and I hope to help put over such

a program by having the producers, the feeders, the packers and the cooperative associations unite on a program of somehow stabilizing the price where there will be a profit in it for each of these groups." "Somehow" is a rather general term, if we understand the English language, but probably "the details are yet to be worked out."

A WEEK OF ORATORY

THE American Institute of Cooperation will be held at Columbus June 16-July 23. Most of this time will be devoted to the study of courses given by Ohio State University. But in one week, July 7-12, six members of the Federal Farm Board will appear on the program. Is such concentration of oratory "orderly marketing" of it or congestion? May it not bring about a seasonal surplus or temporary glut? Possibly these expert purveyors of speech may so coordinate or correlate as to adjust the supply to the crowd's capacity and stabilize the whole thing in such a way that there will be profit in it for everybody.

WHERE TO EXPERIMENT

ONE of our critics declares that various acts of other nations are upsetting the law of supply and demand, therefore we should try such economic experiments as price fixing, regulation of production and control of marketing. He feels that the government may do some good by attempting such things or promoting them. Let us assure him that the old law has not been upset, nor is it likely to be as long as that ancient institution human nature survives. Those who have tried to evade it in recent years with coffee, rubber and copper have learned some lessons which the rest of us should have sense enough to learn by observation rather than by experience. If we must experiment why do it with certainties? Why not experiment in something that commercial experience has not proved to be a failure?

MARKET INFLUENCES

MORE things than the casual observer realizes play a part in the making of prices for any commodity. A recent day's cotton market affords a fair example of this fact. The weather, the receipts, the exports, the takings by spinners, the rate of consumption, the market for cotton goods, the buying or selling by cooperatives, the British market are all mentioned; but besides these are possible production in Egypt, the boycott on foreign fabrics in India, a tariff increase in the East Indies and the instability of silver, which has been for centuries the medium of exchange in the Orient. All of these influences converge at the market place and have their effect, nobody knows just what for each of them. And yet there are plenty of wise men who think that some board or commission could fix the price better than the composite wisdom of all concerned does fix it by actual trading, each trader with his own money at stake.

THE ASIATIC OUTLET

CALIFORNIA fruit interests, casting about for a possible outlet for their increasing production, have looked on the huge population of eastern Asia with enough hope to instigate a comprehensive survey of this potential market. The survey was conducted under the auspices of the University of California and the United States Department of Commerce. Aside from collecting an immense amount of information on the food habits and buying abilities of Japan, China, India, the Philippines and other countries the investigation did little to interest the fruit grower who wants quick results in the way of better markets. For the myriads of the Far East were found to be too poor to buy

American fruits, fresh, canned or dried, in sufficient amounts to have much effect on our markets. However, the surveyors believe that in time a patient and intelligent program of sales effort would have beneficial results. Selling abroad everything that we don't want is a pleasant dream but hard to make "come true." The buyers always have something to say, and in this case they are not even conscious of their needs.

A LETTER FROM INDIA

A LETTER from Sam Higginbottom informs us that after three bad years the Allahabad Agricultural Institute has the largest harvest in its history—and this on "land that a few years ago would not pay for cultivation." He concludes that "the present social customs and religious beliefs of the people offset the advantages of soil and climate and are responsible for their poverty." He reports a great Hindu religious assembly at Allahabad, the Kumbh Mela, attended by five million. He is told that the educated Hindus no longer believe in the Mela but they attend to keep peace in the family, for "the ignorant, superstitious, devout woman dominates the literary, trained, unbelieving man." From which it may be inferred that wherever she is and however she is woman is going to do her full share of dominating. A visit by Mr. and Mrs. Gandhi is referred to, and the political situation reported as "more tense." Gandhi's "adherence to the policy of non-violence is not popular with many of the young hot-heads, who seem determined to bring about bloodshed, though what will be gained by it they fail to make clear." Sam says: "To achieve freedom for India—politically, religiously, socially, economically—is a task that should bind all good men together. At the present juncture I believe that the public opinion of the British in India is for the fullest measure of freedom within the Empire."

COOPERATION OR COERCION?

THE Ohio Wool Growers' Association has issued a statement giving its reasons for withdrawing from the National Wool Marketing Corporation, the Federal Farm Board's central marketing agency. Heretofore the Ohio cooperative has marketed the wools of the Michigan and Indiana organizations. The National Corporation has formed new connections for these two cooperatives and compelled them to abandon their connection with the Ohio body. Moreover the National Corporation is now soliciting consignments in the Ohio cooperative's territory for the purpose of further reducing that organization's volume of business and compelling it to "go along." Apparently cooperation has degenerated into coercion in these three states. The Ohio Association charges "a determined effort on the part of the National to break up existing wool pools which do not see fit to submit to its policies in toto." The Ohio organization expresses fear of "a dealer-controlled, dealer-minded organization interested in cooperation only so long as it best serves their financial ends"; also fear that the selling agency employed will dominate the Corporation and the market as well. The Ohio Association calls attention also to the increase in cost of selling through the National Corporation, or "an increase in cost of operation with less efficient service instead of a decrease (in cost) with more efficient service."

Many small eastern cooperatives, which are interested but not concerned in the Ohio organization's problems, want to know what is the best policy for them to follow. We believe they will do best to continue their past selling policy as long as it is the cheapest. There is no evidence thus far to show that they can net more for their wools by paying a central organization more to sell them.

EASTERN Shore Guernsey breeders showed over 110 animals at their annual Field Day which was held at the Wicomico Air Grounds, Salisbury, Md., last Friday. The dairy industry on the Eastern Shore is comparatively new, but judging from the quality of animals shown at the field meet very progress will be outstanding. Although herds are few in number, it was demonstrated last Friday that there are many exceptionally good animals on the Shore. Those who have started in the dairy business have first secured foundation animals from which they could build a profitable herd.

Thirty-four breeders exhibited cattle, all cattle coming from accredited herds and all animals negative to blood test. W. K. Hepburn, manager of Fellowship Farm, Anselma, Pa., made the showing placings. Homestead Senator, a two-year-old bull owned by W. P. Jackson of Salisbury, was awarded grand championship and senior championship. The junior champion bull was Homestead Foremost Colonel, owned by the Edw. Tull Estate of Princess Anne. Cosquay's Sweet Rose, an aged cow owned by F. Adkins of Hebron, was an easy winner in her class and was awarded the grand champion-ship and senior championship. N. W. Auden, the junior champion, an exceptionally fine heifer shown by Carl Adkins of Hebron, was a strong contender against Cosquay's Sweet Rose for the grand championship.

The first prize three-year-old cow, the Lucky Strike, was shown by Pioneer Point Farm at Centerville. This cow as a two-year-old in Class 2 produced 672 pounds of fat and 1,525 pounds of milk. Homestead's Duchess was the best two-year-old heifer. Coston Goslee, a farmer Guernsey breeder of Salisbury, won a silver Guernsey cream pitcher in showing Myrtle of Valley View, the best two-year-old heifer bred and raised by the exhibitor.

Pioneer Point Farm again carried away a first place with Rose Marie of Pioneer Point in a class of heifers 18 months and under two years. The class of heifers one year and under fifteen months, with 31 individuals entered, was the largest class shown. The Yank, owned by W. P. Jackson, was awarded first place.

In the get-of-sire class W. P. Jackson showed the prize winning get of Star Proud Royal. There were ten entries of four animals each in this class. Produce of Golden Nell of Cosquay, owned by B. Frank Adkins, took first place in the produce of dam class. Following the show the crowd departed to the Wicomico Hotel, Salisbury, for a banquet and evening of entertainment. Speakers of the evening were Karl Müsser, Secretary of the American Jersey Cattle Club; Jimmie Dodge, Emmadine Farm, Hopewell Junction, N. Y., and W. S. Gordy, Salisbury.

LEADING all entries in total production in the Passaic County Egg-Laying Contest are the Rhode Island Reds of Scott Poultry Farm, Groton, Mass. These birds have laid 1,851 eggs, or an average of 185 eggs a bird. Another Red flock from the same state holds second place with 1,822 eggs its credit. The White Leghorns from the Fox and Son Poultry Farm, with a score of 1,750 eggs, rank third in total production and first in the White Leghorn division. Second and third places in the White Leghorn division are held by entries of the Darfelt Poultry Farm at Preukness and the Quality Poultry Farm.

THE Rhode Island Reds from Woodview Poultry Farm Mount Holly, continued to rank as the best scoring of the New Jersey flocks during the thirty-four weeks of the Vineland Egg-Laying Contest. This flock ranks third in total production among all entries with a record of 1,793 eggs. First and second places are held by entries from Massachusetts.

Another New Jersey entry of Reds owned by Ed D. Schaeble, Shiloh, stands seventh in total production and second among the New Jersey flocks. This flock has produced 1,749 eggs.

DECLARE next Wednesday, June 11, a holiday from farm work and attend the annual Farm Field Day at the New Jersey Experiment Station at New Brunswick. This opportunity to become acquainted with the work of the Station and

New Jersey Farm Comment

By G. W. HARRIS

the men who are introducing new and better methods in agriculture should be grasped by every farmer in the state. Specialists will be present during the morning for consultation on various problems. At 10:30, daylight saving time, Dr. Carl E. Ladd, director of the New York Experiment Station, will speak to the gathering on the College campus.

Immediately after lunch tours to the College farms will begin. Special tours have been arranged for those interested in soils, farm crops, dairy, poultry, fruit and vegetables.

A PASSAIC county entry owned by the Fox and Son Poultry Farm, Little Falls, with a production of 1,638 eggs during thirty-four weeks, leads all entries in the Hunterdon County Egg-Laying Contest. The Rhode Island Reds owned by Kerr Chickeries, Frenchtown, holds second place

Time to Clean Up

with a 1,573-egg record. White Leghorns from Jerseyland Farms, Point Pleasant, are tied with a Michigan entry for fourth place. These scores are 1,641 eggs.

Five more New Jersey flocks are listed among the first ten in total production. They include two White Leghorn entries of Joseph Joachim, which stand sixth and seventh with scores of 1,537 and 1,511 eggs respectively; and flocks owned by George A. Pearce, Whitehouse, eighth with White Leghorns, 1,503; Broadview Farms, Blawenburg, ninth, with White Leghorns, 1,463 eggs; and Feindorf Farm, tenth, with White Leghorns, 1,452 eggs.

TWO new auction farmers' markets will open in New Jersey on June 2nd. These are located at Beverly, Burlington county, and at Williamstown, Gloucester county.

The auction markets at Cedarville and Rosenhayn, which have been in operation during the past two years, have been outstandingly successful in marketing fruits and vegetables from those sections. Last week they handled the first of South Jersey's strawberry crop.

JAPANESE beetles are scheduled to make their appearance by June 15th is the report from the Japanese Beetle Laboratory at Moorestown. The beetle territory is about five miles wider this year than last season and includes Trenton, Lawrenceville, New Egypt, Chatsworth, Hammonton, Vineland, Bridgeton, Deerfield, Woodstown and Pennsgrove in New Jersey; Wilmington in Delaware, and in Eastern Pennsylvania as far west as Coatesville, Phoenixville, Doylestown and across to Trenton.

The advice to property owners in this territory is to spray all trees and ornamentals before June 25 if they wish to protect the foliage from the

Favages of the beetles. The lead oleate-coated arsenate of lead, two pounds to 25 gallons of water, is again recommended for non-fruiting trees and plants. Home owners having fruiting trees and small fruits should write to the Japanese Beetle Laboratory at Moorestown for a chart of the recommendations for the various fruits.

County agents will gladly give this spray information to commercial orchardists.

A TURKEY field day is to become an annual event in New Jersey and this year's meeting is scheduled for November 1 on the farm of Samuel Lippincott near Marlton, Burlington county. New Jersey's first turkey field day was sponsored by the Monmouth County Extension Service and for the past two years has been held at the turkey farm of Mrs. A. E. Reid at Manalapan. These gatherings to "talk turkey" were so popular that it was decided to make it an annual affair. A permanent committee was organized to arrange for such an event which is to be held in various parts of the state.

THAT fishermen may angle in comfort, or even take a snooze, without fearing an irritating attack by mosquitoes is a promising feature of the research work on mosquito repellents being done by the New Jersey Agricultural Experiment Station. Pyrethrum insect powder seems to be the most promising of more than 80 chemicals tested by Dr. Willem Rudolfs. When pyrethrum was mixed with petrolatum and tested in the open the first mosquitoes did not alight until one and one-quarter hours nor bite until two hours after the material was applied to the person. Dr. Rudolfs says that it is possible to mix pyrethrum with neutral oils and even with face powders. Every fisherman, summer camper and shore resident will sing praises when Dr. Rudolfs perfects a mosquito relief.

A POTATO tour of the Eastern Shore of Virginia, the eighth annual event, is planned for June 19. Many New Jersey growers will probably accompany this tour group as they visit the lower part of the Shore where the potato harvest will be in full swing. Worcester county, Md., will have its tour on June 20, and the Long Island tour will be held June 25, 26 and 27.

THE nation's mushroom industry is facing a crisis, and the automobile is held to be indirectly responsible, for commercial cultivation of mushrooms is dependent on an ample supply of properly composted horse manure in which to grow these delicious fungi.

All this was revealed at the New Jersey Agricultural Experiment Station, which has received pleas from mushroom growers to develop an artificial manure in which their crops could be grown, or to devise a method for making this material last longer. Now the manure is used only one season and then it becomes worthless for mushrooms.

Taking the lead in this situation is the Mushroom Growers' Association of Pennsylvania, whose members, especially those in Chester county, represent one of the country's leading mushroom growing centers. This association has established a three-year fellowship, amounting to \$1,500 a year, at the New Jersey Station, for the investigations which it hopes will lead to the development of an artificial manure.

The investigations have already been started here under the direction of Dr. Selman A. Waksman, microbiologist for the Experiment Station. In his investigations Dr. Waksman must first determine what the mushrooms take from the horse manure, and then develop a synthetic product with these same constituents.

This first step will require the taking of numerous analyses of horse manure in the mushroom beds; at first before the crop begins to grow, and then successive analyses as the crop develops.

"Our next step will be to make an artificial manure," Dr. Waksman explains. "We already know that by combining straw or other farm residues with certain fertilizers, especial inorganic nitrogen and phosphorus, and keeping these materials moist for from three to six months, a compost is produced that is quite similar to horse manure in its chemical, physical and bacterial properties. Whether or not we can make a compost material that will be suitable for mushroom growing remains to be seen."

"Go West Young Man," Go West with the Rest

The airplane soars where the eagle soared and concrete spans the ridges, but the lure of change and the open range both time and trouble bridges. Over the desert and through the dust, across the pass to the sea, where the dolphins play and the salt-fish slay and seaweed is a tree.

THE history of the nation from a fringe of frost-bitten colonists clinging precariously on the Atlantic seaboard to the bathing beauties wading bravely into the Pacific Ocean has been a westward march. The trail of the pathfinder led toward the setting sun. The log cabins of the pioneer advanced over the Alleghenies, across the swamps of the Central West, merged into the sod houses of the prairies and sheltered the weary and the wicked under tents of mining camps.

With face to the West the settler wielded axe and rifle from the Hudson to the Golden Gate, while the covered wagon and the plow pushed corn rows and wheat fields into the teeth of a retreating wilderness. Cities grew like weeds where wild birds nested and an empire greater than the kingdoms of antiquity popped up with the impudence of youth and opportunity.

From Frontier Days

From the time Lewis and Clark crossed the "backbone of the world" to the present things have been hopping in the West. The romance of the Rockies has caught the imagination of the world, while the facts of achievement are about as hard to swallow. The West is interesting, fascinating, inviting; it has become the mecca of vacationists, the joy of tourists. That is why we have chosen it as the object of a farmers' vacation tour to be conducted by our paper this summer, July 26th to August 10th.

As the sod houses of the squatter replaced the teepees of the Sioux and the Texas longhorn followed the vanishing buffalo, so those crude outposts of civilization have given way to fertile farms and waddling Herefords, to nervous cities and vast commercial and agricultural enterprises, but the romance of the frontier and the cattle trail will linger in our thoughts of the West. The "wild and woolly" may be subdued in reality, but we shall not allow facts to interfere with fancies and childhood conceptions of Deadwood Dick and Cattle Kate days. Regardless of time or circumstance we shall retain our admiration of California Joe, the man who voiced the great American spirit of independence and proper appreciation by declaring he would not fight for a general who did not provide pie for his soldiers.

We can ride in motor cars over paved highways or in comfort over steel rails, but our spirit will be with Buffalo Bill and the bull whackers who were unrestrained by roads, fences or written law. It is of course unfair to the progressive West of today to think of it in terms of Custer's rash courage or Wild Bill's deadly aim, but the West neither can nor will be allowed to forget its glamorous past, a fitting foundation for a great future.

The "Vanishing Race"

Those who go on our western trip will see something of the old-time West, tamed down and dressed up for company, and for that reason far more pleasant than the original article when Sitting Bull was a calf. There will be Indians in native garb, a visit to a reservation in Glacier National Park and plenty of chances to inspect the noble redman in his native haunts, without danger of losing a scalp or stopping an arrow.

There will be views of a "dude ranch," where steer roping and fancy riding are staged for the amusement of visitors, and other views of cattle ranches, where beef is produced in a big way and cowboys follow their picturesque occupation.

Paul Bunyan's blue ox "Babe" measured 36 axle handles between the horns and could haul an acre of tim-

ber at one load, while Paul's mighty axe cut a swath through the forest like a scythe through timothy. But even Bunyan and his impossible operations are dwarfed in comparison with the modern lumber enterprises of the Northwest, where trees grow big and the business is big in sympathy. Machinery more powerful than a blue ox and visions sharper than that of the Hercules of the lumber camps are reaping a harvest of centuries from Oregon's mountain sides. A stop at such a lumber camp will be one of the features of the Pennsylvania Farmer vacation tour this summer. Adam has been criticised and even Eve has not

The Cost of the Tour

THE cost of the Pennsylvania Farmer Pacific Northwest Tour is shown on the Reservation Blank below. When you send in your reservation deposit and the final balance shown opposite the various starting points you are through paying. This one price covers every necessary expense. You can board the Tour Special without a dollar and have a perfectly good time. Of course, you probably will want to take along pocket money for newspapers, souvenirs, laundry, and other personal expenses. But that is entirely up to you.

The cost announced below covers assignment to a standard Pullman section, two persons to a section. Friends may reserve opposite or adjoining sections. Each section consists of a lower berth and the upper above it.

After we receive your reservation deposit we shall send acknowledgment, together with suggestions about what baggage and clothing to take along.

When your final payment is received you will be mailed your credentials, your car and berth assignments, and full instructions about meeting the train. You will need no ticket to board the Tour Special.

Please make your reservations as soon as possible. If you are waiting for friends to make up their minds, send your own reservation now. We'll hold a section near yours for your friend—if they don't wait too long. Use the Reservation Blank below, or a separate letter. If everything isn't clear, don't hesitate to ask questions.

Reservation Blank

Tour Manager, Pennsylvania Farmer,
7301 Penn Avenue, Pittsburgh, Penna.

Sir: Enclosed find check (or money order) for \$20 per person for reservations on the Pennsylvania Farmer Pacific Northwest Tour. I shall join the tour at the town marked below. Before July 15th I shall mail check for the balance of the cost of the tour, which is shown opposite the town I have marked.

| | |
|--|----------|
| PHILADELPHIA, Paoli, Frazer, Coatesville | \$209.92 |
| LANCASTER, Elizabethtown | 297.00 |
| HARRISBURG | 294.92 |
| SUNBURY, Milton | 294.92 |
| WILLIAMSPORT, Lock Haven, Renovo | 292.76 |
| DRIFTWOOD, Emporium Junction | 290.54 |
| PORT ALLEGANY | 288.54 |
| PITTSBURGH, Beaver Falls, Youngstown, Erie | 285.79 |

I understand that the final payment shown above, with my reservation deposit, is the total amount due per person and that it covers all necessary expenses for the entire tour from the town checked, including berth, meals, tips, side-trips, etc. I also understand that all payments will be returned to me if, for any reason, I cannot go.

escaped censure at the hands of generations doomed to labor in "the sweat of their faces." But neither time nor style of garment has changed the attitude of the human race toward apples, the verdict of centuries being that the King of Fruits is mighty easy to take. So persistent has been this idea that orchards have spread from coast to coast, and those of the northwestern corner of the country are among the greatest of the lot.

Whether our feeling toward Eden or the state of Washington be one of reproach or of envy we generally agree that both places would be interesting to see. Since we cannot show our friends the original tree on which grew the forbidden fruit we offer as the next best thing a trip through the famous Wenatchee apple district of Washington. This is a part of our proposed August vacation jaunt for farmers and was selected in the belief that eastern growers will be glad to see at first hand how their competitors in the Northwest manage to stave off the sheriff.

Greatest of Parks

And then there is the Yellowstone, most famous of American parks. The area probably contains the most remarkable aggregation of natural scenic wonders to be found in the same space anywhere in the world.

Among the things which have made Yellowstone the magnet of tourists for generations are its 4,000 hot springs, 100 geysers, rivers, lakes, waterfalls, forests of pine, spruce, fir and cedar, its areas of petrified forests and its profusion of wild flowers.

Sublime canyons, sides brilliant with color, wild animals at times, 200 kinds of birds, and hotels, lodges and roads which make them available to the visitor are a few of the things which attract folks to Yellowstone by the thousands.

In a world of wonders no one can pick out the greatest, but perhaps most people would say that the Grand Canyon is the climax of the Yellowstone. Thousands of tourists have viewed it, struck dumb with its majesty, unable to attempt a description. Here is what the English author Rudyard Kipling wrote about it:

Made Him Dizzy

"All that I can say is that without warning or preparation I looked into a gulf 2,000 feet deep, far below which fish-hawks circled far below. And the sides of that gulf were of wide welter of color—crimson, emerald, cobalt, ochre, amber, splashed with port wine, snow-white, vermilion, lemon and silver grey wide washes. The sides did not sheer, but were graven by time and water and air into monstrous heads of kings, dead chiefs—men and women of the old time. So far below the no sound of strife could reach us, the Yellowstone River ran, a finger-warm strip of jade green. The sunlight played on those wondrous walls and gave hues to those that nature had already laid there. Evening crept through the pines that shadowed us, but the glory of the day flamed in that canyon as we went out very cautiously to a jutting piece of rock—blood-red and pink it was—that hung the deeper depths of all."

But the West has no monopoly of fascination. This country is crowded with monuments to progress from the ferry boats on the Hudson to the great ships of the Columbia. It is full of the marvels of nature from Delaware Water Gap to Powder River (a mile wide and an inch deep) and Horsehoe Falls. It is bulging with inspiration from the clump of iris at the door of a farm tenant's home to the railroad tunnel through miles of solid rock. And yet we can cover a lot of territory and not see these things, our attention being diverted by petty annoyances that take the pleasure from the trip. In our proposed western tour we have endeavored to correct this fault by including the things of unusual significance and by providing for the wants and comfort of the travelers so they will be free to get the most out of their journey. M.

Milly Woodbridge's Trek to the Pacific

The Pioneers of the Peace River Valley

By C. A. Stephens

Copyright, 1930, by Capper-Harman-Slocum, Inc.

SYNOPSIS

Two New England families, who have gone to the Peace River country in Canada to make homes, find themselves in unfortunate circumstances when the railroad, on which they had based their hopes, is not built near where they have settled. One of the families, the Mastermans, moves away, but the other, the Woodbridges, remains in the vain hope that something will happen to create business for the sawmill they have built. The son and daughter advise following the Mastermans' example and go back to civilization while they still have enough money to make the journey, but the father refuses to leave his mill. At last, when it became evident that they could not live through another winter on the Peace river, and after their money had been spent, they started to walk across the thousand miles of wilderness, and mountains stretched between them and the Pacific Coast. With a horse, a cow and later an Indian woman who joins them they cross rivers and forests in slow but determined fashion, living largely on game and fish. The extreme exertion together with wet weather seem to make the father's cough worse until one day he has a hemorrhage of the lungs, losing considerable blood before it stops. Later he seems much better and they go on with renewed courage. One evening the Indian woman, Pinky-Blue, while fishing encounters a grizzly bear and cub. Another night while they are encamped a moose suddenly appears apparently with the intention of attacking the old horse.

some time before being able to go on; and when at length he essayed to do so, they saw that he tottered from weakness.

Both Milly and Winthrop were much concerned; and coming a little later to another small river that fell over ledges into a narrow bay opening out to the lake, they camped for the night. The place was much like the one where they had spent the previous night, and had a fine grassy plat between the encircling crags and the lakeshore where the Jersey could graze at will.

While they were preparing their evening meal, an Indian joined them, carrying a pack of steel traps, an axe and a gun. His face was hideously disfigured by three long white scars and by a nose sadly deflected from its normal position. These drawbacks to success as a wooer did not, however, prevent him from strenuous efforts to induce Pinky to go off with him and share his lot. After they had fed him, he paid his addresses to her for an hour or more, much to Winthrop's amusement and Milly's disgust. But this time Pinky was not to be won. She looked this new admirer over and contemptuously shook her head; and when at last he attempted to seize her hand to pull her along

The Cheerful Plowman

THAT "SECOND MILE"

HE is not obligated to patch this road, I know, the statute has not stated he must do so-and-so. No man could call a sheriff and say, "My dear, my dear, I swear by king and tariff, by magpie, saint, and seer, you must get out your scraper, your huckskins, and your plow, and cut a little caper right here, at once, and now." You must fill in this hollow that spoils this stretch of road, this spot where autos wallow, where men unload the load. Two days of honest labor will fix this nice as prunes; your present cursing neighbor will then start singing tunes!"

No sir, no legal action, no "thou-shalt," said to say, can bring the kind of traction that's needed here today.

But why, I'm speaking plainly, should any man for years allow this mud-innately to clog our running-gears, to torment friends and strangers, to worry folks to death, to hamper priests and rangers, to make us gasp for breath?

Why must good deeds be ordered by laws and sheriffs' lists, why must they be embroidered with printed legal twists? Why won't the average fellow say, "Here's a chance, by jing, to make this old world mellow for cabbage and for king?"

Why won't the average neighbor say, "Here's a chance, I wit, to ease that fellow's labor, to help that rent a bit"? Why won't the average mortal try changing groans to smile, why does he smirk and chortle about that "second mile"?

J. E. T.

after him, Pinky displayed unusual energy. She gave him such a slap that he stalked away, muttering a number of very lefthanded compliments to her. Pinky flung them back, however, with interest and added a few pointed remarks as to his personal appearance; the most of which being in the aboriginal language is happily beyond translation.

This singular visit had been so diverting, not to say exciting, that scant attention was paid for the time being to Freeman Woodbridge's condition. Soon after the tent was pitched and the bed of grass and blankets prepared, he had lain down; and both Milly and Winthrop supposed he was resting as usual from the fatigues of the day. Somewhat later, as they were picking up the day, cleaning the camp kit for the night, Milly heard him speak in what seemed thickened tones, and on going to him, found that he had been attacked by another hemorrhage from the lungs. She at once called Winthrop, and they did what little they could—which under the circumstances was little, indeed. This hemorrhage proved much worse than previous ones, continuing for an hour or more and resulting in much loss of blood. The poor man was quite pallid and cold when finally the alarming flow ceased. He was wellnigh speechless, and merely whispered in reply to the anxious inquiries of his distressed children. They covered him warmly and a little later induced him to take a kind of beef tea made from steaks of the moose meat, which they had brought with them from the camp where Old Peregrinations had perished.

Next forenoon he seemed even weaker and wholly disinclined to talk. An even worse symptom was his utter disinclination for food. Hitherto his appetite had been noticeably good. He had eaten so well, indeed, that Milly had all along felt quite confident that he would recover. The sharpest anxiety now oppressed them—painfully increased by a word that the squaw let fall. After helping Milly tidy up the tent that morning, she stood regarding the recumbent figure in silence for some time, then coming away, shook her head sagely and said, "He no get well. He die pelly soon."

As their father was manifestly unable to travel, no effort was made to go on that day or the next. At first, they hoped and believed that he would rally in the course of a few days and that his courage would return; but they told me that on the third day he called Milly and Winthrop into the tent and, quite as a matter of course, began giving them advice for the rest of the journey and for the future generally. It was with a pang that they perceived he had given up all hope of recovering and that he did not expect to leave the place where they were now encamped. This gloomy conviction no doubt reacted on his physical strength, for day after day dragged by and he did not improve. Rather he grew weaker.

MEANTIME all sorts of worries beset Milly and Winthrop, not only for their father but for their own fate. Not more than half the long distance to Prince Rupert had been traversed; they knew not what was before them and now cold weather was at hand. Sharp white frosts rendered the mornings very chilly. It would soon be too cold to sleep in the tent. Yet to move on was impossible. Freeman Woodbridge had become too weak to rise to his feet without assistance. Perhaps he might have ridden the old horse, if that staunch friend had remained to them; but to walk for hours daily through rough country was plainly impossible for him.

They could do nothing but remain camping there by the waterfall and care for him. Winthrop repined and cast many reflections on the folly of starting upon such a journey. Those were bitter days for Milly. At times she nearly lost heart. The squaw, too, appeared uneasy; she would stand regarding them strangely for whole minutes at a time, as if fearful. Some aboriginal instinct warned her that they ought to go on, or prepare for winter.

Food such as it was abounded. Flocks of ptarmigan swarmed on the grassy flats round the lake, and were so tame they would scarcely fly from under foot. Pinky knocked over dozens of them with a long pole. Great flocks of ducks and geese, too, came to the lake daily on their southward migrations; and there were trout in the pool below the waterfall.

Several days of rain succeeded, which at length turned to sleet and ended with high, cold winds and snowflakes.

(To be continued.)

The Farm Home

Culinary Lore for Campers

CAMPING days are with us once more. The great army of campers is on the march. Hikers, automobilists, trolley car riders, and even those to whom old Dobbin is still a method of transportation, are once again taking overnights, week-ends, or full vacations, as campers.

Pup-tents, wall-tents and teepees; aluminum kits, mess kits and make-shift kits; pots, pans, pails and toasting forks; fishing rods, guns, revolvers, and even bows and arrows, for archery are again to the fore; blankets, sleeping bags, quilts and robes—all those things which have to do with camping have been aired, cleaned and packed so that the summer army may be properly equipped.

Campers are getting wiser each year. The day of the hot dog and ham and eggs has not entirely passed, but experienced campers are now able to turn out much more elaborate dishes over their outdoor fires. Hundreds of thousands of adult campers are grown-up replicas of their boy scout days, when they were forced to prepare elaborate dishes in order to acquire some coveted badge for cooking—and naturally, this group is well able to prepare praiseworthy meals.

There are a few very important things for each camper to learn and to remember once he or she has learned.

Seasoned with Cinders

First, do not attempt to prepare the ordinary meal on or over a blazing fire. It blackens your pots and pans, and, as a rule, does not cook the meal properly. Smoke, cinders and bits of leaves drop on the chops or steak, and one is indeed fortunate if things turn out satisfactorily.

The first Americans insisted that the white man made a big fire that was no good, while the Indian made a little fire that was "much good," and we are forced to admit that the red man was correct. A blazing fire is all right when a sixteen-pound ham is to be boiled for several hours, but glowing embers are far better for lamb chops, fried beef or steak.

The second thing to remember is that the camp mess must be balanced as well as the home-cooked meal, if the trip is to be one hundred per cent perfect. This means that greens, fruits and other alkaline foods must have a place on the menu.

Those who know water cress, dew berries, wild strawberries and such things, have a decided handicap over the camper who is not so well acquainted with Mother Nature. A few wild strawberries, with cream from a nearby farm house, and a teaspoon or two of sugar from the sugar canister, is a dessert that will please any one. The strawberries are alkaline, the cream is filled with calories, and the sugar is a quick energy food.

Third, and by no means the least important, is the suggestion that sugar be used liberally. The fact that it is a quick source of energy makes it fit wonderfully into the camping trip. It may be used at night to make camp-fire candy. It may be used at breakfast for fruit and cereal. It may be used during the heat of the day to prepare a lemonade for the kiddies. All these things the average camper knows.

But sugar should be used with camp-cooked green vegetables as well. A little added to the water in which these vegetables are cooked will bring out the full flavor of the vegetables and add to the food value of that particular dish. Do not add enough sugar to sweeten the vegetables, but merely enough to give them that zestful flavor which is the final, perfect flowering of the outdoor cook's art.

Remember these three hints when next you start on a camping trip. Betty Barclay.

"The Flower of the Flock"

"My sister, Clara, two years younger than I, was a beautiful child," said a woman well known for her wide experience and broad sympathy. "Clara was round and rosy, with brown curls, lovely blue eyes and a pink and white complexion. I was exactly the opposite, thin, tall, dark and scrawny, with stringy hair."

"If I went out without my sister, I was happy, but there was never any chance for me when with Clara. People always looked at her and exclaimed, 'Oh, what a lovely child!' and never seemed to know that I was present. I would go home just

heart-broken, feeling that I never wanted to go anywhere again. This made my childhood most unhappy, for I couldn't help resenting the fact that Clara received all the attention."

"Mother was very wise. She never made any comparisons, and if reference was made to my plainness, she always said that actions went farther than looks. As we grew older, I surpassed Clara in school and so drew a small share of attention which helped to bring me to a more peaceful state of mind."

This woman's most vivid recollections of her childhood seemed to be of the unhappiness that she had experienced through jealousy. Another friend of mine who had suffered similarly because of a beautiful sister said her family didn't seem to understand how deeply the contrasts and comparisons made hurt her, and the feeling she had toward her sister was really deplorable; she grew almost to hate her.

It is the parents who are usually responsible when there is a family jealousy, when a child, because of the beauty or accomplishments of another, becomes difficult, suspicious, inclined to

The Country Church

The country church,
In some great day
The country church
Will find its voice
And it will say:

"I stand in the fields
Where the wide earth yields
Her bounties of fruit and of grain;
Where the furrows turn
Till the plowshares burn
As they come round and round again;
Where the workers pray
With their tools all day
In sunshine and shadow and rain.

"And I bid them tell
Of crops they sell
And speak of the work they have done;
I speed every man
In his hope and plan
And follow his day with the sun;
And grasses and trees,
The birds and the bees,
I know and I feel every one.

"And out of it all
As the seasons fall
I build my temple away;
I point to the skies
But my footstone lies
In commonplace work of the day;
For I preach the worth
Of the needy earth—
To love and to work is to pray."

—Liberty H. Bailey.

"carry a chip on his shoulder" or to have an inferiority complex. It is very easy to arouse this jealousy by giving undue attention to one member of a family who happens to be more gifted or finer looking than the others.

The following story by a pre-school study group leader suggests a wiser way of treating "the flower of the flock":

"We had guests from Chicago the other night. A young niece with her husband and three little girls—Peggy, five; Joan, three and a half; a baby, seven months.

"Having heard a great deal from the relatives of the smart and lively Joan, we had eyes only for her when they arrived. She lived up to her reputation, and we thought her a wonderful child. But we soon began to be interested in what the father and mother were saying about Peggy—how when only two years old, she had remembered putting her mother's diamond ring under a table cover several weeks before, how she often brought back unusual stories from the Sunday school.

"After the departure of our guests, I found myself thinking of the retiring Peggy really more than of the vivacious Joan. In fact, I recalled that very little had been said of Joan. Could it be that these parents had learned to apportion the attention given to the two children? Certain it was that much of our attention had been wisely redirected by them thus preventing the younger child from becoming too forward or vain and the older one from feeling neglected and jealous."

Janette Stevenson Murray.

Carbon Bisulphide Kills Ants

If you would successfully and permanently get rid of ants, the first thing to do is to find the colony and destroy the queen, according to Dr. Glenn W. Herrick of the Cornell University agricultural experiment station. When the queen is gone no more eggs will be laid, and the production of workers will stop.

To destroy the nests and kill the queen, carbon bisulphide is one of the best substances to use. If the colony can be found in a place where carbon bisulphide can be used, pour an ounce or two of the liquid into each of the several holes made in the nest with a sharpened stick, and then quickly stop up the hole with a clod of dirt. A heavy wet blanket thrown over the place helps to retain the gas and make it more effective. The liquid evaporates quickly and its gas permeates the whole nest, destroying the colony. The gas is inflammable and explosive and no form of fire or light should be brought near the place which is being fumigated.

Tartar Emetic

Where the colony cannot be found or reached with carbon bisulphide, Professor Herrick recommends the use of tartar emetic. Mix tartar emetic with extracted honey at the rate of one part to twenty parts of honey. Pour some of this mixture into individual butter plates set in the places where the ants are troublesome.

A third way to get rid of ants is to use sodium fluoride. Dust this powder about the places where the ants frequent. The use of a weakly poisoned sirup is a fourth way recommended by Professor Herrick. The workers carry this to the nest, feed it to the young, and thus it gradually kills off all the individuals and in the end destroys the colony. Such a sirup may be made by dissolving one pound of sugar in one quart of water and adding 125 grains of arsenate of soda. The mixture should be boiled and strained.

Neighbors

How convenient it is to have neighbors—especially if they are not so close they can land us turn over in bed. We have lived near a variety of folks in town, but I like better the arm's-length neighbors of the farming section.

Here in the maple sugar country everybody is interested the first warm days of February or March, watching for signs of tapping across the valley and up the hollow. The gleam of buckets, some sapbush, the rumble of a gathering tank over the stones, the smoke and steam at a sap-house—all these are signals for the rest of the sugar makers to get busy. The close of the season, as well as the opening, gives evidence of our interest in what the neighbors do.

Just so with haying. The whirr of a mowing machine at dusk is said to be a sure sign of rain. When one farmer meets another on the road, the store, or at some community meeting, they compare notes on the progress of the season's work—unless they discuss their respective automobiles or school troubles.

The annual school meeting brings rural neighbors together for a common purpose. We may learn self-expression there and, perhaps, some self-control when we have to give up to the majority.

Probably farm women have greater interest in their husbands' business than city or town women because they are nearer to the process and results. Yet the women find much pleasure in purely domestic affairs with one another, helping occasionally with tying quilts and the like.

The truly rural organizations have their share also, in making us more neighborly. The Farm Bureau and Home Bureau with their various projects, the Grange with its social emphasis, all stand in the friendly atmosphere of the community.

Just because the old-time "bee" is out except for barn-raising, is no proof that farmers and their families are independent. The close friendliness of all the folks along the road comes out when one family needs to replace a building destroyed by fire, or when somebody is sick or dies. No matter how busy with their own affairs, genuine neighbors show themselves in time of need.

Vida M. Bates.

Tub Frocks for June Days

No. 6866.—Girls' dress. Cut in four sizes: 8, 10, 12 and 14 years. A 12-year size requires 2 1/2 yards of 35-inch material. A 14-year size will require 2 3/4 yards. Price 15c or two for 25c.

No. 6867.—Girls' dress. Cut in four sizes: 8, 10, 12 and 14 years. A 12-year size requires 2 1/2 yards of 35-inch material. To finish with bias binding requires 6 1/2 yards of 35-inch material. Price 15c or two for 25c.

No. 6868.—Misses' dress. Cut in three sizes: 16, 18 and 20 years. An 18-year size requires 2 1/2 yards of 35-inch material. To finish with bias binding requires 6 1/2 yards of 35-inch material. Price 15c or two for 25c.

No. 6869.—Misses' dress. Cut in three sizes: 16, 18 and 20 years. To make the dress and jacket of one material requires 4 1/2 yards of 35-inch material for an 18-year size. Price 15c or two for 25c.

No. 6870.—Girls' dress. Cut in five sizes: 12, 14, 16 and 18 years. A two-year size requires 1 1/2 yards of 22-inch material. The shoulder bow requires 1 1/2 yards of ribbon. Price 15c or two for 25c.

No. 6871.—Child's rompers. Cut in three sizes: 6 months, 1 and 2 years. A 2-year size requires 1 1/2 yards of material 32 inches wide or wider, together with 2 1/2 yards of bias binding put on as illustrated. Price 15c or two for 25c.

No. 6872.—Ladies' morning frock. Cut in nine sizes: 38, 40, 42, 44, 46, 48, 50, 52 and 54 inches bust measure. A 48-inch size requires 3 1/2 yards of 36-inch material together with 1/2 yard of contrasting material. The width of the frock at the lower edge is 1 1/2 yards. Price 15c or two for 25c.

No. 6873.—Boys' suit. Cut in four sizes: 2, 3, 4 and 5 years. A 4-year size requires 1 1/2 yards of 35-inch material. Pockets of muslin require 1/4 yard. Price 15c or two for 25c.

No. 6874.—Ladies' pajamas. Cut in four sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches, bust measure. A medium size requires 4 1/3 yards of material 32 inches wide. To finish with bias binding requires 8 1/2 yards 1 1/2 inches wide. Price 15c or two for 25c.

No. 6875.—Ladies' Apron. Cut in four sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches, bust measure. A medium size requires 4 1/3 yards of material 32 inches wide. To finish with bias binding requires 8 1/2 yards 1 1/2 inches wide. Price 15c or two for 25c.

HOW TO ORDER

Write plainly, giving pattern number and size. Address Pattern Department, Pennsylvania Farmer, 7301 Penn. Ave., Pittsburgh, Pa.

TWO HELPERS INSTEAD OF ONE IN EVERY BAR
That's why

MILLIONS AGREE

"NOTHING CAN TAKE THE PLACE OF FELS-NAPTHA"

MILLIONS of women use Fels-Naptha for all their washing and cleaning because they know it brings them extra help. Extra help they could hardly expect from any other laundry product—regardless of color, form or price.

For Fels-Naptha isn't "just soap."

It's a marvelous combination of good golden soap and plenty of naphtha, the safe dirt-dissolver. You get two cleaners instead of one in every bar. Working together, they give you extra help that loosens the most stubborn dirt and floats it away without hard rubbing. Washing is easier, quicker—and when it's over how sweet and clean the clothes are!

Whether you use tub or machine; whether you soak or boil your clothes; use Fels-Naptha and get extra help. In

pipng hot water, and even in cool, it does a splendid job. And does it so quickly that your hands are in the water less time. Which, of course, helps keep them nice-looking. Ask your grocer for Fels-Naptha today.

SPECIAL OFFER—We'll be glad to send every user of Fels-Naptha Soap a Fels-Naptha Chipper. Many women who chip Fels-Naptha into their washing machines, tubs or basins find this chipper handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naphtha) just as you need them. Send only a two-cent stamp to cover postage, and we'll mail you this chipper without further cost. Write today. Department 7-6-7, Fels & Company, Philadelphia, Pa.

GERMOZONE

The Life-Saver for Chicks

You cannot avoid the disease germs and bacteria that are picked up from the floor and droppings, you cannot avoid contamination from germ-laden little feet, you cannot avoid particles of spoiled or moldy food. But with a single teaspoonful of Germozone to the quart of drinking water three times a week, you can avoid the crop and bowel infection and diarrhoeas that the germs and bacteria so surely bring on.

Each year increasing thousands of Germozone users save their chicks from this greatest danger. Leading hatchermen recommend Germozone, many public institutions and experiment stations use it. **SAVE YOUR CHICKS.** A trial bottle, at our expense, will show you that your big losses can easily be avoided.

Give Germozone if your chicks already are sick. Use it for all sick birds.

At drug, feed and hardware dealers and chick hatcheries (only at a town); or from factory, postpaid, 12-cents bottle, 10c qt., \$1.50 gal., \$1.50. 64-page textbook on diseases, free.

Potatoes Sprayed with Pyrox Yield 50 Bu. More per Acre

"MY 22 acres of potatoes sprayed with Pyrox averaged 50 bu. more per acre than where other sprays were used," writes Mr. J. D. McFaun, Manager of the Hillside Farm, Vintage, Pa., under date of Nov. 5, 1929. He says: "The quality of the potatoes is so good that I am getting \$2.00 per bu.—which means a 20c premium—at the Lancaster, Pa., market."

At \$2.00 per bu., Mr. McFaun's increased yield obtained by protecting his potatoes with Pyrox, amounted to \$100 an acre. Other growers report similar extra profits from crops sprayed with Pyrox.

Pyrox is a combined insecticide and fungicide, the growth of thirty years' experience. It is scientifically prepared to kill insect pests, control blights, and other diseases and to stimulate plant growth. It is quick and easy to use. It does not clog the

Mr. J. D. McFaun, Mgr. of Hillside Farm, Vintage, Pa.

nozzles and sprays in a fine mist. It has the best of sticking and covering properties.

Spraying with Pyrox is a profitable operation. Not only are the increased yields obtained which normally result from spraying, but an additional yield which will pay for any difference in the cost of Pyrox several times over. Pyrox is now priced lowest in 31 years. See your dealer today and get a copy of the new illustrated Pyrox Spray Guide.

Make More on 4 Loads than on 5 Loads Potatoes

YOU have to pay for grading potatoes and onions, whether you grade them or let someone else do the work. And you can do your grading for less than you pay to have it done.

In many sections one truckload of ungraded spuds in five is culls and dirt. By removing this trash on the farm you save sacks, save carting, save paying freight on worthless stuff.

Boggs machines grade up to 550 bu. per hour into No. 1 and No. 2 sizes, with less than 3% variation from Government sizes, and eliminate culls and dirt. Won't bruise or injure even green stock. And with the Roller Picking Table, potatoes are automatically turned over so that it is impossible to miss picking out rots and defects.

An A-1 pack always brings higher prices. With a Boggs you save help, too. It does the manual labor of three to five men.

Made in several models, to be operated by hand or power, at \$19.00 and up. Quick delivery from our factories at Atlanta, N.Y., and Detroit Lakes, Minn.

Our catalog tells how to make more money. Mail the coupon for a free copy.

Punishment

JOAN was having a delightful time entertaining her cousins, Elizabeth and Ben, and two little neighbors, Louise and Jimmy.

The five children had played games, eaten ice-cream and plain cake, and now were resting in the cool shade of the plum trees.

"Oh, dear, look at the spots on my dress," said Louise.

"Will your mother spank you?" asked Elizabeth.

"No-o-o, I don't think so."

"Course she won't spank you unless she gets mad with you 'cause she will have to wash the dress," remarked Jimmy.

"My daddy doesn't whip me unless he catches me doing something bad," volunteered Ben, "so I sure try to keep him from finding out what I do."

"My father spanked me yesterday 'cause I took some of his tobacco for Roy and Peter. I don't think he should be so mean. He had a lot of tobacco and I know he couldn't miss what I took," was Jimmy's contribution.

"Oh, but he punished you so you'd remember not to take what didn't belong to you," explained Joan.

"Aw, no, he didn't! He did it just 'cause he wanted the tobacco all for himself. When I get as big as he is I'll take all I want, and I bet he won't whip me."

"Mother got mad and spanked me because I didn't know she wanted me to watch the baby and he pulled a knife off of the cabinet and cut his finger," thoughtfully said Louise.

"Well," said Elizabeth, "Mother sure did spank me last week for losing her umbrella, and I had never touched it. She found it in the rack where she had put it herself."

"Mother hardly ever spanks me," said the little hostess, "and then it is just to make me remember not to do the bad things again. She hates to do it, too."

"Oh, gee, my mother doesn't hate to," interrupted Jimmy. "She just gets mad and takes her spite out on me over just anything."

"We both cry when my mother has to spank me. We don't either of us like it. But it sure makes me remember not to do the things she tells me are wrong," continued Joan.

All were silent for a few minutes thinking the thoughts of little people about the unfairness of adults, perhaps.

"Let's play tag some more!" suddenly exclaimed Elizabeth. "You are it, Jimmy," and away they went—childish philosophy forgotten for the moment.

Of the five, one, only, had any mental wholesome idea of the value of punishment. Lenora Bailey.

The Tourist Hostess

THE rural homemaker who is planning to make her spare rooms pay by entertaining automobile tourists this summer will do well to use these spring days to put the last-minute touches on her house before the heavy highway travel begins.

Success in the business of running a tourist home often depends on details and these are well worth considering early. When the overnight guest is taken to his room he should find it cool, clean and comfortable. Windows on different walls are important to allow for cross ventilation. Full-sized screens allow windows to be opened top and bottom when necessary for comfort and ventilation, yet give protection against flies. No guest is satisfied who finds a musty and stuffy bedroom where the windows can be opened only a few inches. Awnings and window shades are also helpful in keeping out the heat and glare from the hot summer sun.

Bedrooms that look and are spotlessly clean and restful are paying investments, long remembered by guests. In choosing the furniture,

rugs, curtains, bedspreads and the finish of walls and floors, it is well to consider not only appearance and expense, but ease in cleaning as well.

The bed, generally the most important piece of furniture in the room from the tourist's point of view, should be, above everything else, immaculate and comfortable. The chief thing which the tourist home sells is rest. This is what guests pay for and they cannot get it on a corn husk mattress or one that sags in the middle and is full of humps. If you invest in good springs, mattresses and bedding and give them the best of care, they will be found most economical in the long run.

Strawberries and Jam

ONE of the best combination preserves is made from strawberries with fresh pineapple. It is easy to make and has a fine and unusual flavor. Directions for making it are given by the Bureau of Home Economics.

One large fresh pineapple, two quarts strawberries, sugar.

Remove the skin and "eyes" from the pineapple and cut it into oblong pieces, and then into inch cubes. Discard the core. Measure or weigh the pineapple, add equal measure or weight of sugar, put the mixture into a large pan over low heat, stir until the sugar is melted, bring to a brisk boil, and cook for ten minutes stirring constantly.

Divide the smaller berries from the larger ones and to each lot add three-fourths of their measure or weight of sugar. Add the small berries and sugar to the cooked pineapple and cook for ten minutes; then put in the larger berries and sugar. Cook this whole mixture for 30 to 35 minutes or until the jelly test is reached. Allow the jam to stand overnight in the saucepan in which cooked. In the morning reheat to the boiling point and pour into sterilized glasses. Cover with paraffin, seal, label and store in a cool, dry place.

About Birthdays

IS next Monday Mary's birthday? Celebrate. Is Friday little Bobbie's? Celebrate. Recognizing the significance of birthdays is a happy custom. Children are delighted and the memories of such occasions cling pleasantly in after years. Older folks are pleased to be honored; in fact, we all are.

If the celebration be elaborate, well and good; but a simple one will be a success. A batch of cookies, a cake with candles, a dish the honored one prefers or any little touch a bit out of the ordinary will bring a broad smile of appreciation.

It is a good idea to keep a supply of small birthday candles on hand. They cost only a trifle and when needed, there they are. Sometimes an invited guest has a birthday on the very day you entertain. Just last week I invited a family of four for dinner. During the meal one of the small boys happened to say, "This is my birthday." When dessert was served his eyes opened in surprise at the sight of eight tiny red candles flaming from his piece of cake.

Marguerite McCreary

FRESHLY-PICKED greens may be canned now for meals next winter. Shrink them first; then can either by using a steam pressure cooker or by adding acid and cooking in the cans in a hot water bath.

Avoid overloading the washing machine. If the clothes can move about freely during washing, the cleansing action is more effective and there is less strain on the machine.

Light, airy clothes closets equipped with hangers for dresses and coats and racks for shoes and hats lengthen the life of clothes and save time and expense in caring for them.

MORE PEOPLE BUY USED BUICKS THAN MANY MAKES OF NEW CARS

"We want a man's sized car. We want power and roadability. We'll get infinitely more miles and thrills in a used Buick than in a new car of comparable price. Clearly, Buick is the better buy."

It is very possible that this thought is engaging your mind, as it is engaging the minds of tens of thousands of other buyers. For this is the way America is thinking.

The proof is that more people buy used Buicks than many makes of new cars. In fact, so great is the popularity of the used Buick, that it actually outsells the big majority of new cars—for the very reasons you have in mind.

A used Buick provides more power—more swiftness, smoothness and stamina—more of all the good motoring qualities... because Buick is wonderfully designed and wonder-

fully made by craftsmen who have held leadership in fine car building for a quarter-century. And a Buick is always a Buick. It continues to perform in the same smooth, even-tempered way whether the speedometer reads 10,000 or 100,000.

Act upon your own convictions. Decide now to purchase the Buick you've long wanted. And make satisfaction doubly sure by taking this additional step—

Buy your Buick from an authorized Buick-Marquette Dealer. He conditions his Buicks carefully—prices them fairly—and offers them on the most reasonable terms. His establishment is the place in your community to buy a used car.

Make More on 4 Loads than on 5 Loads Potatoes

YOU have to pay for grading potatoes and onions, whether you grade them or let someone else do the work. And you can do your grading for less than you pay to have it done.

In many sections one truckload of ungraded spuds in five is culls and dirt. By removing this trash on the farm you save sacks, save carting, save paying freight on worthless stuff.

Boggs machines grade up to 550 bu. per hour into No. 1 and No. 2 sizes, with less than 3% variation from Government sizes, and eliminate culls and dirt. Won't bruise or injure even green stock. And with the Roller Picking Table, potatoes are automatically turned over so that it is impossible to miss picking out rots and defects.

An A-1 pack always brings higher prices. With a Boggs you save help, too. It does the manual labor of three to five men.

Made in several models, to be operated by hand or power, at \$19.00 and up. Quick delivery from our factories at Atlanta, N.Y., and Detroit Lakes, Minn.

Our catalog tells how to make more money. Mail the coupon for a free copy.

Punishment

JOAN was having a delightful time entertaining her cousins, Elizabeth and Ben, and two little neighbors, Louise and Jimmy.

The five children had played games, eaten ice-cream and plain cake, and now were resting in the cool shade of the plum trees.

"Oh, dear, look at the spots on my dress," said Louise.

"Will your mother spank you?" asked Elizabeth.

"No-o-o, I don't think so."

"Course she won't spank you unless she gets mad with you 'cause she will have to wash the dress," remarked Jimmy.

"My daddy doesn't whip me unless he catches me doing something bad," volunteered Ben, "so I sure try to keep him from finding out what I do."

"My father spanked me yesterday 'cause I took some of his tobacco for Roy and Peter. I don't think he should be so mean. He had a lot of tobacco and I know he couldn't miss what I took," was Jimmy's contribution.

"Oh, but he punished you so you'd remember not to take what didn't belong to you," explained Joan.

"Aw, no, he didn't! He did it just 'cause he wanted the tobacco all for himself. When I get as big as he is I'll take all I want, and I bet he won't whip me."

"Mother got mad and spanked me because I didn't know she wanted me to watch the baby and he pulled a knife off of the cabinet and cut his finger," thoughtfully said Louise.

"Well," said Elizabeth, "Mother sure did spank me last week for losing her umbrella, and I had never touched it. She found it in the rack where she had put it herself."

"Mother hardly ever spans me," said the little hostess, "and then it is just to make me remember not to do the bad things again. She hates to do it, too."

"Oh, gee, my mother doesn't hate to," interrupted Jimmy. "She just gets mad and takes her spite out on me over just anything."

"We both cry when my mother has to spank me. We don't either of us like it. But I sure makes me remember not to do the things she tells me are wrong," continued Joan.

All were silent for a few minutes thinking the thoughts of little people about the unfairness of adults, perhaps.

"Let's play tag some more!" suddenly exclaimed Elizabeth. "You are it, Jimmy," and away they went—childish philosophy forgotten for the moment.

Of the five, one, only, had any mental wholesome idea of the value of punishment.
Lenora Bailey.

The Tourist Hostess

THE rural homemaker who is planning to make her spare rooms pay by entertaining automobile tourists this summer will do well to use these spring days to put the last-minute touches on her house before the heavy highway travel begins.

Success in the business of running a tourist home often depends on details and these are well worth considering early.

When the overnight guest is taken to his room he should find it cool, clean and comfortable. Windows on different walls are important to allow for cross ventilation. Full-sized screens allow windows to be opened top and bottom when necessary for comfort and ventilation, yet give protection against flies. No guest is satisfied who finds a musty and stuffy bedroom where the windows can be opened only a few inches. Awnings and window shades are also helpful in keeping out the heat and glare from the hot summer sun.

Bedrooms that look and are spotlessly clean and restful are paying investments, long remembered by guests. In choosing the furniture,

rugs, curtains, bedspreads and the finish of walls and floors, it is well to consider not only appearance and expense, but ease in cleaning as well.

The bed, generally the most important piece of furniture in the room from the tourist's point of view, should be, above everything else, immaculate and comfortable. The chief thing which the tourist home sells is rest. This is what guests pay for and they cannot get it on a corn husk mattress or one that sags in the middle and is full of humps. If you invest in good springs, mattresses and bedding and give them the best of care, they will be found most economical in the long run.

Strawberries and Jam

ONE of the best combination preserves is made from strawberries with fresh pineapple. It is easy to make and has a fine and unusual flavor. Directions for making it are given by the Bureau of Home Economics.

One large fresh pineapple, two quarts strawberries, sugar.

Remove the skin and "eyes" from the pineapple and cut it into oblong pieces, and then into inch cubes. Discard the core. Measure or weigh the pineapple, add equal measure or weight of sugar, put the mixture into a large pan over low heat, stir until the sugar is melted, bring to a brisk boil, and cook for ten minutes stirring constantly.

Divide the smaller berries from the larger ones and to each lot add three-fourths of their measure or weight of sugar. Add the small berries and sugar to the cooked pineapple and cook for ten minutes; then put in the larger berries and sugar. Cook this whole mixture for 30 to 35 minutes or until the jelly test is reached. Allow the jam to stand overnight in the saucepan in which cooked. In the morning reheat to the boiling point and pour into sterilized glasses. Cover with paraffin, seal, label and store in a cool, dry place.

About Birthdays

IS next Monday Mary's birthday? Celebrate. Is Friday Little Bobbie's? Celebrate. Recognizing the significance of birthdays is a happy custom. Children are delighted and the memories of such occasions cling pleasantly in after years. Older folks are pleased to be honored; in fact, we all are.

If the celebration be elaborate, well and good; but a simple one will be a success. A bath of cookies, a cake with candles, a dish the honored one prefers or any little touch a bit out of the ordinary will bring a broad smile of appreciation.

It is a good idea to keep a supply of small birthday candles on hand. They cost only a trifle and when needed, there they are. Sometimes an invited guest has a birthday on the very day you entertain. Just last week I invited a family of four for dinner. During the meal one of the small boys happened to say, "This is my birthday." When dessert was served his eyes opened in surprise at the sight of eight tiny red candles flaming from his piece of cake.

Marguerite McCreary

FRESHLY-PICKED greens may be canned now for meals next winter. Shrink them first; then can either by using a steam pressure cooker or by adding acid and cooking in the cans in a hot water bath.

Avoid overloading the washing machine. If the clothes can move about freely during washing, the cleansing action is more effective and there is less strain on the machine.

Light, airy clothes closets equipped with hangers for dresses and coats and racks for shoes and hats lengthen the life of clothes and save time and expense in caring for them.

MORE PEOPLE BUY USED BUICKS THAN MANY MAKES OF NEW CARS

"We want a man's sized car. We want power and roadability. We'll get infinitely more miles and thrills in a used Buick than in a new car of comparable price. Clearly, Buick is the better buy."

It is very possible that this thought is engaging your mind, as it is engaging the minds of tens of thousands of other buyers. For this is the way America is thinking.

The proof is that more people buy used Buicks than many makes of new cars. In fact, so great is the popularity of the used Buick, that it actually outsells the big majority of new cars—for the very reasons you have in mind.

A used Buick provides more power—more swiftness, smoothness and stamina—more of all the good motoring qualities... because Buick is wonderfully designed and wonder-

fully made by craftsmen who have held leadership in fine car building for a quarter-century. And a Buick is always a Buick. It continues to perform in the same smooth, even-tempered way whether the speedometer reads 10,000 or 100,000.

Act upon your own convictions. Decide now to purchase the Buick you've long wanted. And make satisfaction doubly sure by taking this additional step—

Buy your Buick from an authorized Buick-Marquette Dealer. He conditions his Buicks carefully—prices them fairly—and offers them on the most reasonable terms. His establishment is the place in your community to buy a used car.

Fighters can't train with PILLOWS!

A fighter's muscles must have vigorous, hardy exercise to keep them strong and firm—in condition. Imagine a fighter trying to train on soft, flabby pillows!

Teeth can't train on “MUSH”

IF TEETH, and gums, are to be firm, sound and healthy, they've got to train on sterner stuff than the soft, mushy foods which form so large a part of modern diets.

For teeth and gums which are not sufficiently exercised will deteriorate just as surely as muscles which are little used. They require constant care. They lose their soundness, their firmness. So declare America's leading Doctors of Dental Surgery. And that is not all.

Your own doctor and dentist will tell you that the origin of many serious illnesses has been traced to unhealthy conditions of the teeth and gums.

Teeth and gums need more than daily cleansing, say these knowing men. They must have exercise. They must learn to *chew*. And what

pleasanter way to give them their needed exercise than in the way Nature intended—by eating delicious foods which actually *invite* thorough chewing?

Such a food is Grape-Nuts. It is highly thought of by dental and medical authorities, not only because it gives teeth and gums the brisk exercise they urgently need—but also because it helps to *build* sound teeth.

Grape-Nuts is made from wheat and malted barley. Its golden-brown, nut-like kernels, are crisp and crunchy. You want to chew them thoroughly. And as you do, teeth and gums get the stimulating exercise Nature planned they should have. And every time

you eat Grape-Nuts with milk or cream your body receives a rich supply of

calcium and phosphorus, the two elements so important to the building of sound, beautiful teeth.

Indeed, in this single delicious dish is practically every food element needed for the health and energy of the entire body. A single serving of Grape-Nuts with milk or cream, supplies more varied nourishment than many a hearty meal!

Your grocer has Grape-Nuts. Buy it today, for breakfast tomorrow. Or if you wish, you can mail the coupon below for a free trial package.

It is easy to understand why the new Chevrolet Six is winning such widespread popularity. All you need to do is compare it with any other automobile of comparable cost—*value for value and price for price!*

You will discover that Chevrolet is the only low-priced car that gives you the outstanding advantages of a six-cylinder motor. And if you have ever driven a six-cylinder car, you know what a difference six cylinders make—in smoothness, power, flexibility, long life and greater driver comfort!

You will discover that Chevrolet is the only low-priced car with bodies by Fisher—a factor of the utmost importance in determining value. Chevrolet-Fisher bodies are built of selected hardwood and steel—assuring thousands upon thousands of miles of quiet, carefree service. They are carefully padded to prevent drumming and rumble. And they offer every modern safety and convenience feature.

You will discover that Chevrolet is the only low-priced car combining all of these modern chassis features—four long semi-elliptic springs; four Lovejoy hydraulic shock absorbers; completely-enclosed internal-expanding 4-wheel brakes; banjo-type rear axle; and a heavy channel steel frame, with four rugged cross members.

And when you investigate economy, you will make another important discovery—for the Chevrolet Six is just as economical as any car you can buy. It costs no more for oil. It costs no more for gas. It costs no more for tires. It costs no more for service. *And it is sold at prices anyone can afford.*

Before you consider any other low-priced car, compare it with the new Chevrolet Six. *Compare values! Compare prices!* The more thorough your comparison, the more certain you are to conclude that “It's wise to choose a Six!”

CHEVROLET MOTOR COMPANY, DETROIT, MICHIGAN

The Most Powerful Tractor of its Size on Four Wheels

AGAIN Oliver offers a great advance in Power—The Oliver Hart-Parr Model A—a 4-cylinder, 4-plow tractor.

It is lower, shorter, narrower, better—a more compact farm power unit that will handle more easily, work more freely, produce power more economically—the new Oliver Hart-Parr Model A.

The new valve-in-head motor (patents applied for) burns kerosene or gasoline and from either gets more power per dollar of fuel cost. A new type force feed lubrication system, new type balanced cooling system, new type fuel system, make this most efficient type of motor even more efficient.

The Oliver Hart-Parr Cooling System directly forces the coolest water in the system against the hottest part of the motor, keeping the ignition chamber and the valves free from overheating. The problem of crankcase dilution is greatly lessened.

The power transmission parts from the 3-inch main bearings to the 3½-inch driving axle are larger, stronger, made of superior metals. Ball and roller bearings are more plentifully used. Metal has been placed where metal counts.

The Oliver Hart-Parr Model A, in chassis, motor and transmission, offers every modern improvement and some that are entirely new. It is fully enclosed outside to protect the works within. Inside, it presents a

Under the
Oliver Flag

A 4-plow tractor, the successor to the world-famous leader of farm power—the Hart-Parr 18-36.

More ball and roller bearings
Really handy belt pulley
More driver comfort
New cooling system
Beauty and Balance
More alloy steels

60-inch over-all height
79½-inch wheel base
117-inch over-all length
39-inch inside tread
5600 lbs. of weight

new cleanness and trimness of design, free from the usual projections, and is much more accessible.

The Oliver Hart-Parr Model A also offers the farmer many new conveniences: the low, roomy, dust-proof platform; a movable, adjustable, spring-hung seat; automobile type foot clutch; handy gear shift lever. The operator rides in comfort with a fine view of the work.

It also offers new operating advantages—the drawbar is adjustable up and down and in a wider arc to accommodate any tool or any setting of a tool to meet unusual conditions.

The belt pulley is right out in the open so that the belt can literally be thrown on.

It's from the shops of Hart-Parr, founders of the tractor industry, long holders of leadership in power.

Besides the sensational new Row Crop, this new Oliver Hart-Parr takes its place under the Oliver Flag that leads to lower costs of producing crops.

Write for immediate information on this most powerful tractor of its size on 4 wheels.

PENNSYLVANIA FARMER

(789) 17

Electric Hot Water Incubator Proves Success

A 16,000-egg, oil-burning incubator at the hatchery of Howard Findlay of Chester county, Pa., recently was converted to electric operation by replacing the oil burner, and water coil, with a 35-gallon tank storage type electric water heater of 5,000 watts capacity.

Water is maintained in the tank automatically at a temperature of 140 degrees. A valve controlled by the air temperature within the incubator allows this hot water to circulate through the incubator, whenever the temperature falls below 100, and shuts off circulation whenever it rises above this point. The 35 gallons of hot water held in storage is a more than ample reserve in case of sudden changes in outside temperature, interruption of electric service, or putting in cold eggs to trays.

Uniform Temperature

This year when the owner put in cold eggs the temperature of the incubator dropped four or five points daily, and came back within about three hours to 100. When the hatching season is over, the length of time over which the incubator can be held at 100 degrees, with current shut off, will be measured. It has been estimated at from 18 to 24 hours. This is far longer than any probable interruption to electric service would last, but in case of sudden changes in temperature outside, or putting in cold eggs, this very large reserve maintains temperature evenly.

Cost of operation is always important, and it is interesting to know that it has cost but little more than oil to operate this incubator. When the savings in time, and absence of fire hazard and fumes, etc., are considered, it is much more economical than the former system. Little chicks held in the incubator room prior to sale appear to be brighter, the owner says, and ascribes this to the fact that they do not breathe any fumes from an oil burner.

The mechanical details are quickly outlined. The heater is a regular household water heater rebuilt for installation. There are two 2,500-watt heating elements each thermostatically controlled. One goes on when the water in the storage tank

falls below 140 degrees F; the second operates only when the water in the tank falls below 120 degrees, which is practically never except when heating up the system, or in case of failure of the first unit to operate. The combined capacity of both elements is such that the heater can raise about 20 gallons of water 100 degrees each hour.

Heat Regulation

The heater is set so that the water level is below the top entrance pipe to the incubator. Circulation is completed when the lower return pipe is connected to the inlet of the heater. A valve in the upper pipe controls circulation according to the air temperature within the incubator. The same valve is used that controlled the circulation from the oil-burning hot-water coil. With that, however, there was no surplus hot water storage.

Heat regulation within the incubator is very exact. A recording thermometer showed a normal variation of less than one-half degree.

The tank is well insulated and all outside pipes are well covered. To use electric heat economically, all heat losses must be prevented insofar as is possible. An expansion tank and air vent is placed at the highest point of the system. Water evaporates through the pipes, and a small amount must be added through the expansion tank from time to time. The expansion tank serves also as an air vent, which is necessary because air in the pipes will impede proper circulation.

This system can no doubt be adapted to take care of battery brooders and other similar uses requiring a mild even heat with plenty of surplus for sudden cold weather, interruptions to service, etc. We have on our lines a house heated on somewhat the same plan. House heating in this manner is yet in the experimental stage, and is also rather costly. Applications in the poultry industry where labor is an item, and the value of the product is high, as in the case of baby chicks, are undoubtedly practical, and more profitable to use than the older methods.—Stanley Bidlack, Rural Service Agent, Chester Valley Electric Company.

Garden and Truck Crops

By GILBERT S. WATTS

THIS evening I enjoyed a visit from a gardener friend located in the Marietta, Ohio, early cabbage and tomato district. Unusually severe freezes late in April caused serious damage to the cabbage crop. Possibly 30 per cent of the plants in the fields were killed outright. So extensive a loss may have an important bearing on the market for very early Pennsylvania cabbage. We are giving our planting the best care possible.

THE asparagus beetles have been very numerous in many patches this spring. Perhaps the easiest way to keep these pests under control in small plantations is to fence and then stock with active young chickens. How fortunate it is that chickens do not have a liking for asparagus.

UNSEASONABLY late frosts constitute one of the gravest risks that the tomato grower must face. When danger seems imminent one of the speediest, least expensive and absolutely sure means of protection is to bend the plants over to one side and cover lightly with soil.

If a handful of soil is first scooped into a mound close to the stem a very large and stiff plant may be covered with negligible injury. On one occa-

sion I left earth protected tomato plants covered during four days of cold weather. In case of rain, however, I imagine that might prove too long.

SEVERAL weeks ago I planted some bush beans through special bean plates used in a standard make of corn planter. A perfect job of spacing was secured, but I was afraid to use high analysis fertilizer in the machine because the mechanism put the fertilizer right in with the beans. Nevertheless I planted six rows in that way. The remainder of the piece was first made up into fertilized rows with a modernly equipped potato planter. After that the beans were planted without any fertilizer. In the first case we have a very poor stand of beans. In the second full rows of evenly spaced plants promise a bountiful crop.

IN another field a potato planter was used to throw up low, fertilized ridges on which squashes have been planted. The squashes are eight feet apart and midway between each two squash rows we have a row of extra early sweet corn which will produce additional returns from the land without interfering at all with the major crop.

THE YOUNG PEOPLE

Roses All the Year

THE beautiful garden rose is one of the simplest roses to simulate and an amateur craftsman may readily make these charming blossoms by carefully following the instructions.

You will need blush pink crepe paper for the blossom, moss green crepe paper for winding the stem, spool wire for tie wire, a medium weight wire for the stem, artificial stamens and rose leaves, and a tube of library paste.

How to Make the Garden Rose

Center: Take about 15 rose stems, double them, so as to use both

ends, and fasten with a five-inch piece of No. 2 wire, leaving two short ends for handling.

Petals: For the petals, cut across the grain, a strip of selected crepe paper three and one-half inches wide and as long as desired, allowing 36 inches for each rose. Fold the strip, with the grain, to not exceeding eight thicknesses, and place rose petal pattern on the folded thickness, from tip to base with the grain, and cut out the petals. Each rose will require from 20 to 24 petals.

For the first three petals, stretch the paper all around the tips of the petals, and then pinch the edges together, bending them forward about one-eighth inch from the top, or curl and crush them over a knitting needle. Lay the three petals aside, and keep them separated, in the order in which they will be used.

Flute the next six petals all together, once in the center edge, and cup them and cut into two and one-half inch squares. Fold a square piece diagonally. Hold this diagonally folded square in the left hand, with the tip of the left forefinger at the center of the long folded edge. Wrap the paper around the finger closely, first one end and then the other. Slip the finger away and gather the bud about one-half inch down from the top.

Stem: For the bud and flower stems cut across the grain a strip of moss green crepe paper one-half inch wide, and as long as desired.

Full directions for completing the rose, assembling the spray and wrapping the rose stem will be found in our booklet mentioned below. Order your copy now and make these roses while you have the real rose as a pattern.

Some Picnic Games

The Bird-Catchers

DIVIDE the crowd into two teams and each team has its own goal line. One side decides on the name of a bird and when they are ready the two teams come toward each other until they are about five feet apart. Then the other team starts to guess the name of the bird the other side has chosen. When some one has guessed it then the children on the side whose name was discovered must run for home just as fast as they can for fear the opposite side will catch and claim them as prisoners.

Obstacle Race

The course is not longer than fifty yards, and a line of obstacles is set out for each one of the three teams, two men or boys in each team.

Runners No. 1 start the race. They are to:

1. Go through a barrel.
2. Sing up the scale.
3. Turn two somersaults.

The Boys' Cabin on the Hill

By C. S. WALKER

Where are the boys who would not enjoy having a part in building and furnishing such an ideal "club house?"

COUNTRY boys who have a hankering for carpenter tools may often surprise the home folks with their ingenuity and workmanship. All they usually need is a bit of help from parents in securing materials and tools.

A few years ago two boys built this splendid cabin photographed for your inspection. They did it in their spare time in just a few months. They

4. Take off their shoes and put them on again.

5. Climb a designated tree. They then hurry back to touch off No. 2 of their team, who must go through the same performance. There is one rule that is strictly enforced. That is that the singing must be done clearly and distinctly and as musically as possible!

Sweden's Four-H Song

THE Young Farmers' League of Sweden follow much the same plan as the Four-H clubs of America. Following is a translation of the song which has been adopted by these groups. It was written by Sigurd Svenson, secretary of the board of directors of the league.

Young Farmers' League Song

Let us listen to the song of the pines,
Let us love the beach where from the reeds nearby
Comes a murmur like a fairy tale from our happy childhood,
Like a gay melody which still lingers in the billow.
See our native place is the coope,
Where the queen of the fairy tale comes young and rosy every spring.
Windflowers smile in her pathway,
Yes, this is our native place
We are all young,
Let us sing a lively melody.

Let the message go over wood and hill
To the youth who are the flower of the land and the heart of the people,
Let it awaken those who sleep in the peaceful valleys.

For in the morning light,
In the loud murmur of the birch
And in the spring brook's roar,
From their sleeping homes
All the young people shall go forth
To plow and sow
Around the red and gray cottages.

Now is the time of plowing, now is the time of sowing.

The sowing time is spring, and spring is the time of our youth's happy conflict.
Let our seed be good, let it be covered up and sprout.

Let it shoot up and be nourished by our bright faith in the future.

Days after, years after,
The harvest will come,
We must stand together,
Large and small!
Hand in hand to victory we must go!

(To be continued.)

have parents who believe in encouraging boyhood's dreams, and these parents helped to provide the necessary slabs and the working tools.

The youthful builders did the rest, and I wish you could visit the interesting camp on the hilltop. It is twelve by sixteen feet—a one-room cabin, and they even made the furniture. That is rustic, too, and there are seats, shelves and a bunk, all lending atmosphere to this happy haunt.

The fireplace is very artistic and lends warmth and comfort in cool seasons when schoolmates and friends want to gather there for an outing.

The log slabs were fitted snugly together, and spiked to stout foundation beams inside. There are two doors made of lighter slabs, and the splendid windows are fitted with plain board shutters.

The visitors are legion and every one who comes into this woodland admires this cabin. It is built to stand for years—a product of boyish idealism and unusual skill.

Little Folks

A Discontented Boy

By LUCRETIA K. MAMMEL

KENNETH BROWN was seven years old. He lived on a lovely little farm with his father and mother and little brother Dickey. The home was near a small town where Kenneth went to school. His father took him to school in the morning, and his mother went for him when school was out.

Kenneth liked to go to school very much, but the trouble was he did not like to go home. He wanted to stay in town with his playmates and play in the streets. His grandmother lived in the town, and sometimes he was allowed to stay. But of course, his mother wanted him some of the time and there were so many things to do on the farm. Little Dickey wanted him to play with, too.

Every day when mother went to bring him home it was the same thing. Kenneth would say:

"Aw, gee, mother! Why don't you let me stay and play with the boys? There's nothing to do at home."

It made mother feel very badly to think her little boy would rather play in town than come home with her and little Dickey. "Why, Kenneth, dear!" she would say, "you have so many, many things you might do. You have your swing and your dog, and you have all the dirt you want in which to play. How would you like to live in the city and not have even a backyard?"

"I'd like it," grumbled Kenneth. "I don't have a sliding board or a seesaw here like they do in the play ground at school."

"But you can't have everything," patiently explained his mother.

Finally, mother got tired of this complaining and decided to let Kenneth see what it was like to live in a real city. So she sent him at vacation time to visit his aunt who lived in a nearby city. He was to stay ten days and not see Mother or Daddy or Dickey in all that time.

(To be continued.)

IF a cow slips in a meadow
Of clover pink and sweet,
Do you think she'll break the buttercups
That grow about her feet?
The cat-tails are not really tails
Of pussy cats you know,
They're only just a kind of grass
That in the meadow grow.
The tiger lily isn't fierce
Although her name is so,
She's just like all the other flowers
That sweetly bend and blow.
Now children, get a ruler
And a pencil sharpened fine
And see if you can draw a cow
That's just as nice as mine.
—Lahome Editor.

West Virginia.

Farmer's Business Letter

THERE is added emphasis in this territory with respect to the better feeling in regard to business. More people are heard to talk about it, and it is entirely probable that confidence is on the way to being restored.

Farm conditions generally continue good, though weather has been unfavorable—cloudy and cold, with some rain. Corn made a great start, and so did the cutworms, with the result that much corn has had to be replanted in some sections.

Hogs Show Strength

The hog market continues to show strength—not much in the way of advances, but a good demand for hogs right along. The trade is about convinced that the supply of hogs for the remainder of the year will be less than last year. And with pork the favored meat under present conditions, no one wants to get caught short on it.

The run was pretty good considering the holiday week, the total at eleven points being only 20,000 short of last week when 488,000 were received. For the year to date the run is now 550,000 under a year ago.

There was a nickel gain in the average price this week, which now stands at \$10.10 against \$10.65 a year ago and an average of \$11.10 for the same week during the past five years.

Trading in the futures market was quite active and prices were 10 to 15 cents higher than last week. Light hogs for September delivery sold at \$10.35; medium weight hogs the same for September, and at \$10.25 for June delivery; and heavy hogs at \$10.05 for June delivery.

Cattle Lower

With a pretty liberal Monday run here the cattle market declined, but recovered later, and at the close was 25 to 50 cents under a week ago.

The week's supply at near 10,000 was 2,000 short of last week and about in line with recent weeks. For the year to date twenty markets have received 4,126,000 cattle, against 4,164,000 on the same date last year, 4,535,000 in 1928 and 4,906,000 in 1927.

Bulk of steer sales this week was at a range of \$10.12 to \$11.25, with the average at \$11.10, which was 40 cents below a week ago. Top steers brought \$14 this week, which was 35 cents under last week, and top yearlings sold at \$13, or 75 cents below last week.

Lambs Higher

The lamb market made further gains this week, with the supply the smallest in some time. The run here totaled only a little over 47,000, against 61,000 last week. Aged lambs were a half dollar higher, at the close, and springers gained \$1.12.5. Sheep were a quarter higher, with only limited supplies. Top aged lambs sold at \$10.75, and top springers at \$13.65.

Receipts included about 20,000 California springers, the supply from this state for the season now totaling 168,000 against 220,000 on the same date last year. The spurt in the lamb market is regarded as temporary, but likely to continue to the middle of next month when the Idaho start, and a liberal supply is expected from that state.

Grains Steady

The usual crop scares are appearing in grain trade reports, but they have little effect, because they are unimportant, and also because the trade is completely dominated by Farm Board operations. There was very little net change in prices during the week, the close being almost in the same notch as the opening. The only new development was in unconfirmed reports that the Canadian pool had made important export sales. Harvesting of winter wheat has already started in this country, first reports coming from north central Texas. Foreign crop reports were quite unfavorable, especially in Russia, where spring seeding is just being completed.

Chicago, May 31, 1930

Watson

Produce Market Review

THE Philadelphia egg market opened slightly higher on Monday but on Tuesday prices dropped back. On Thursday prices advanced one cent on both Western and nearby arrivals. The advance was rather unexpected. The quality of the eggs arriving was irregular but an improvement was noted in many shipments. The trade, while not operating freely, took a fair hold of the better stock and receivers were forced to push sales on undergrade

goods. The pre-holiday buying on Wednesday was fairly satisfactory and dealers cleared their floors fairly well. Storage packed goods were offered within a range of 26¢ to 27¢.

The New York egg market followed practically the same course as the market in Philadelphia. The market was firm at the close with the increased holiday demand. Nearby henry whites were quoted at 24¢ to 25¢ per dozen, nearby henry browns at 27¢ to 28¢ with lower grades as low as 24¢. Gathered current collections of mixed colors were quoted at 19¢ to 26¢ while Pacific Coast white eggs ranged from 27¢ to 34¢.

Butter Unsettled

The butter market was unsettled during the week. Arrivals of fresh butter were heavy in eastern markets during the early part of the week and prices declined. Trading continued unsatisfactory despite the lower price level and some of the finer grades were sent to storage. The very conservative policy of banks and warehouses in making loans on butter has undoubtedly curtailed speculative buying. Retail prices of butter are lower than for several years and it is believed that a low price is needed to keep consumption, especially in the face of industrial depression in many sections.

Plenty of Poultry

Receipts of live poultry were liberal in New York with the majority of the nearby arrivals consisting of broilers. The demand for broilers was slow except for fancy stock. The market held steady on Rocks and Reds but was irregular on Leghorns. Leghorn fowl were quoted at 20¢ to 21¢ per pound and colored fowl at 24¢ to 25¢. Rock broilers were selling at 30¢ to 45¢ per pound, and at 25¢ to 38¢ and Leghorns at 15¢ to 30¢. Long Island and other nearby ducks brought 20¢ to 23¢. Squabs brought 25¢ to 30¢ per pair with jumbo fancy squabs bringing 60¢ to 75¢. Dressed poultry receipts from the nearby states were light. The market was about steady

with a fair demand for broilers. Broilers were quoted at 40¢ to 48¢ per pound and squabs white at 40¢ to 45¢.

Strawberry production in the late group of states, according to a recent report issued by the U. S. Department of Agriculture, is expected to be about 3 per cent lighter than in 1929, due to a reduction in acreage and to lower yields. A crop of 74,558,000 quarts of berries is estimated for this group. Of this total, Pennsylvania expects 6,512,000 quarts and New York 9,658,000.

The volume of strawberry shipments from the Eastern Shore sections of Virginia, Maryland and Delaware is running behind that of a year ago. This decrease appears to be due to a later season as well as the fact that yields are light and acreage smaller.

The New Jersey berry season has opened and shipments by truck are fairly active. In general the market has been quite satisfactory this week with a good demand for good berries. There have been fairly large quantities of poor berries from all sections which sold slowly at low prices. The various varieties have been selling at prices ranging from 10¢ to 20¢ per quart in the Eastern markets.

Asparagus

Cool weather through the asparagus season caused receipts to fall off sharply in Philadelphia and New York. There was also more stock showing white. The demand was fairly active and prices advanced, with the best stock as high as \$4 per dozen bunches in Philadelphia and \$5 in New York. The recent rains improved potato prospects in the Eastern Shore of Maryland and Virginia. The first cars from Northampton county are expected around June 10. South Carolina is the center of supply at this time and within the next week North Carolina will begin active shipping. The crop in North Carolina is lighter than last year due to prolonged drouths. It appears as though there will be little overlapping of producing sections this year and if this continues up the coast it will be a great help to all concerned, and especially to the New Jersey growers.

W. R. W.

LIVESTOCK

PITTSBURGH

Monday's supply was light, around 30 carloads, but the demand was not urgent and prices showed little change. A few well-finished heavy steers brought \$12.25, but at the close good weight steers could have been had for \$12, and the market was practically on that basis. A few very nice heavy-weight steers brought \$11.50 to \$11.75, with fleshing kind \$11.12 to \$11.25 and fair light steers \$10.50 to \$10.75. Best light steers here went at \$11.40, with very useful fleshy kind around \$11 and fair killers \$10.25 to \$10.50. No feeder steers on sale. Heifers were scarce, few good enough to sell above \$10. Fat cows were wanted but good ones were too few to make a market. Medium class sold better than last week at \$8.50 to \$9.25 largely. Canners brought \$8.50. Probably \$8.50 would be about the limit for good fat cows. A few nice heavy-weight bulls brought \$9.25 to \$9.50, bulk of good butcher bulls \$8.25 to \$8.50 if not too heavy. Heavy bulls sold at \$8.25 to \$8.50, a few very choice at \$8.40. Dairy-bred bulls ranged from \$7 to \$8 according to flesh, a few light thin bulls at \$6.50 or less.

Prime fat steers 12 00 to 12 25
Good to choice, do. 11 75 to 12 00
Fair to good, do. 11 50 to 11 75
Plain heavy steers 10 50 to 11 00
Good heavy-weight steers 11 50 to 11 75
Choice butcher steers, 1,000 to 1,150 lbs. 11 00 to 11 50
Fair to good, do. 10 50 to 11 00
Ordinary to fair, do. 10 00 to 10 50
Common, do. 9 00 to 9 75
Good light butcher steers 11 00 to 11 25
Good to good light steers 10 25 to 10 75
Common to medium, do. 9 75 to 10 25
Inferior light steers 8 50 to 9 50
Feeders 9 00 to 10 00
Cocker Nominal
Choice fat heifers 10 00 to 10 50
Good to choice heifers 9 00 to 9 50
Common to fair heifers 7 00 to 8 50
Choice fat cows 7 50 to 8 00
Good to choice fat cows 6 50 to 7 50
Common to fair cows 5 75 to 6 50
Fresh cows, calf at side 50 00 to 125 00
Choice heavy bulls 8 25 to 8 50
Choice heavy butcher bulls 8 75 to 9 00
Good butcher bulls 8 25 to 8 75
Fair to good bulls 7 75 to 8 25
Common to fair bulls 7 00 to 7 75
Inferior bulls 6 00 to 6 75

Clipped

Good to best wethers 5 50 to 6 00
Good mixed 5 00 to 5 50
Fair to good, do. 4 00 to 5 00
Common to fair 3 00 to 3 75
Inferior sheep 2 00 to 3 00
Good to best lambs 10 75 to 11 25
Mixed lots 9 00 to 10 00
Culls and common 5 00 to 8 00
Spring lambs 8 00 to 13 00

Calves

Monday's supply was about 1,500 head. Top calves were steady at \$12 per cwt. Seconds were rather slow at \$8.50 and inferior brought \$5.75.

CHICAGO

Cattle Chicago, June 2.—Cattle receipts totaled around 20,000 head. The market was steady with top steers selling at \$14.

Hogs

Sixty-six thousand head, including 40,000 "directs," made up the supply. The market was steady to a dime higher. Top hogs brought \$10.50, bulk \$10.10 to \$10.35.

Sheep

About 12,000 sheep and lambs were on sale. Best kinds were steady, others unevenly lower. Best springers brought \$13.50, while top on yearling lambs was \$10.50.

LANCASTER

Cattle Lancaster, June 2.—Today's receipts were about 700 head. The market was fairly

active at steady prices. Best 1,300-lb. steers brought \$12, while the bulk of steers sold at \$10.25 to \$11. Stockers and feeders were slow at steady prices. Two hundred calves were on sale. The market was steady to stronger. Best yearlings went at \$13.

Hogs

The supply consisted of around 300 head. Market steady to strong. Top hogs, in the 160 to 230-lb. class, sold at \$11.75.

Produce Market Quotations

PHILADELPHIA
Butter.—Higher than extras, 35¢ to 36¢; 92 score, 34¢; 90 score, 32¢.
Eggs.—Fancy select, 28¢ to 30¢; extra firsts, 25¢ to 26¢; firsts, 24¢; seconds, 21¢ to 22¢.
Poultry.—Live, broilers, 21¢ to 22¢; old roosters, 15¢ to 18¢; pigeons, pr., 15¢ to 20¢; ducks, 15¢ to 20¢; turkeys, 16¢ to 25¢.
Fruits.—STRAWBERRIES, Del. Va., N.J. & Md., 32¢ to 41¢ crates, best, \$2.50 to \$7.50; AP- PLES, N. J. & Pa. bus., Winesap, \$2.75; Romes, \$2.50 to \$3.25; Ben Davis, \$1.50; HUCKLEBERRIES, N. C., 32¢ to 41¢ crates, best, \$8.
Vegetables.—ASPARAGUS, doz. bunch crates, green, N. J., Md., Dela. & Pa. \$1.45 to \$2.25; BEANS, N. C., bu. hmpas, var., \$1.50 to \$2.25; SWEET POTATOES, N. J., Md., Dela., 1/2 bkt., \$1.25 to \$1.75; RIBBONS, Pa. & N. J., per bunch, 14¢ to 30¢; SPINACH, Pa. & N. J., bu., 10¢ to 25¢; PEAS, Va. & Md., bus., 50¢ to \$2; N. J., 1/2 bkt., \$1.41 to \$1.75; MATOES, Pa. hot house, per lb., 10¢ to 25¢; RADISHES, Pa. & N. J., bus. bunch, red & white, 25¢ to \$1; LETTUCE, N. J., crates, Big Boston, 50¢ to \$1; POTATOES, Maine Gr. Mt., U. S. No. 1, 100-lb. sack, \$2.50 to \$3; S. C. hba., Cobblers, U. S. No. 1, \$4.75 to \$5.25; TURNIPS, N. J., bus., 75¢; KALE, Pa. — N. J., bus., 10¢ to 25¢; CAROLINE, Pa. & N. J., bus., 20¢ to 35¢; COL- LARDS, Pa. & N. J., bus., 10¢ to 25¢.

NEW YORK

Butter.—Creamery, higher than extras, 33¢ to 34¢; firsts, 29¢ to 32¢; seconds, 27¢ to 28¢; 92 score, 34¢; 90 score, 32¢.
Eggs.—White, nearby, average, 25¢ to 26¢; extra firsts, 23¢ to 27¢; mediums, 24¢ to 25¢.
Poultry.—Live, by freight, fowls, 21¢ to 25¢; broilers, 20¢ to 23¢; old roosters, 16¢; geese, 12¢; ducks, 16¢ to 18¢; turkeys, 15¢ to 25¢.
Fruits.—STRAWBERRIES, N. J., 10¢ to 25¢.

LANCASTER

Butter.—Country butter, 50¢ to 55¢; cream- ery butter, 45¢ to 50¢.
Eggs.—Fresh, 24¢ to 26¢.
Dressed poultry.—Chicken, \$1.25 to \$2.50 each; springers, 65¢ to \$1.25 each; ducks, \$1.50 to \$2.50 each; squabs, 25¢ to 50¢ each.

Fruits.—APPLES, 20¢ to 30¢ 1/2 pk. STRAW- BERRIES, nearby, 25¢ to 30¢ per qt. box. Vegetables.—A S I A H A G U S, 10¢ to 20¢ per bunch; BEANS, (Lima), 40¢ pint box; BEETS, 8¢ to 10¢ bunch; CABBAGE, 10¢ to 20¢ head; CARROTS, 8¢ to 10¢ bunch; CAULI- FLOWER, 25¢ to 40¢ head; CELERY, 10¢ to 25¢ bunch; CUCUMBERS, 8¢ to 15¢ each; EGG PLANTS, 20¢ to 30¢ each; ENDIVE, 5¢ to 10¢ head; LETTUCE, 10¢ to 20¢ head; MUSH- ROOMS, 25¢ to 30¢ per pt. box.

YORK

Butter.—Country, 40¢ to 45¢; separator, 45¢ to 50¢.
Eggs.—Fresh, 24¢ to 26¢.
Poultry.—Hens, 22¢ to 26¢; Leghorns, dressed, \$1.25 to \$1.50 each; heavy hens, \$1.40 to \$1.50 each; springers, dressed, \$5.00 to \$6.00 each.
Vegetables.—POTATOES, 18¢ to 25¢ 1/2 pk.; \$1.75 to \$2.75 per bu.; new, 18¢ to 20¢ 1/2 pk. CAR- BAGE, 10¢ to 25¢ head; CELERY, 8¢ to 20¢ stalk; FLOWERS, 25¢ to 40¢ head; CAULI- FLOWER, 25¢ to 40¢ head; BEETS, 8¢ to 10¢ bunch.

PITTSBURGH

Butter.—Nearby tubs, 32¢ extra and standard, 27¢ to 28¢; 80 score, 34¢; 88 score, 29¢; Prints 1¢ higher.
Eggs.—Nearby firsts, second-hand cases, 21¢ to 22¢; extra firsts, new cases, 22¢ to 23¢; nearby henry whites, 23¢; browns, 22¢ to 23¢.

Poultry.—Live hens, heavy and medium, 24¢ to 25¢; Leghorns, 20¢; broilers, 35¢ to 40¢; turkeys, 25¢ to 30¢; old roosters, 15¢; geese, 12¢; ducks, 16¢ to 25¢; pigeons, 35¢ to 45¢ per pair; turkeys, 18¢ to 24¢.

FEED MARKET

The following quotations are for transit and nearby shipping. May 29, according to the U. S. Bureau of Agricultural Economics. They show the approximate cost delivered per ton (all in 100-lb. sacks) and grain per bushel in carlots arrival draft basis delivered on track at Phila- delphia and Scranton rate points:
Brn, \$30.50 to \$32.50; standard middlings, \$30.50; flour middlings, \$33; cottonseed meal, 43 per cent, \$47.50; gluten feed \$37.50; No. 2 white oats, 53¢; No. 3 low corn, 95¢.

THE WOOL MARKET

More activity was reported in the wool market last week, both at the Atlantic seaboard and the West. Prices at the latter are about five per cent higher than at the recent low point. Foreign markets are also firm as a rule.

In the fine-wool territory of southwestern Pennsylvania, a large amount of wool changed hands. Growers sold freely at 25¢ per pound, the wool going largely to representatives of eastern mills.

The U. S. Department of Agriculture's Market News Service quotes fine strictly combed wool (delaine) at Boston at 30¢ to 31¢, fine clothing 29¢ to 30¢, half-blood strictly combed 28¢ to 29¢, three-eighths blood strictly combed 27¢ to 28¢, clothing 26¢ to 27¢; quarter-blood 25¢ to 26¢, and common and braid 25¢ to 26¢.

Milk cooling house of E. L. Shockley of near Snow Hill.

Optimistic Dairymen

By L. F. COLLINS

ALTHOUGH Worcester county, Maryland, boasts a million-dol- lar industry in her potato rais- ing, and has eight other major indus- tries—tomatoes, sweet potatoes, strawberries, poultry, fruit, oysters and fish—seven of which are connect- ed with the soil, yet the baby of the soil, dairying, and it is only a little over a year old, bids fair to bring an even hundred thousand dollars into the coffers of its supporters this year, as well as adding much to the values of the farms through its production of animal fertilizer, that the many acres of wornout land need.

Up to July, 1928, there were ten dairy herds on Worcester's 191,650 farm acres, estimated as worth about \$200,000,000, and they supplied milk only for consumption by the leading owners. In this typically rural county nearly every family had a cow, but there were few pastures. Acres and acres of waste land, too poor to raise crops, owners too poor to get it into a plow or just brush. The natural fertility of the soil had been exhausted in the years since early colonization.

In good farms continued overprod- uction of potatoes and consequently low prices had reacted unfavorably for the farmers. So the county agent, prominent farmers and public spirited business men—who felt the pinch of the farmers' lack of money, also— began to look about for a new indus- try that would prove an all-year- round and fairly sure thing.

The Beginning

On October 1st, 1928, a cooling sta- tion was opened in Snow Hill, the county seat, and seventeen cans of milk were shipped that night to Phila- delphia. Things did not look very encouraging then, but all county or- ganizations pulled together. Carloads of fine Guernseys, Jerseys and Hol- steins were shipped in and sold for cash by dealers. Progressive farmers attended sales and brought in blooded dairy stock to improve their herds and much of the sixty thousand dol- lars that the cooling station brought into Worcester county last year has gone into equipment and cattle. This shows that the farmers are taking this proposition seriously.

At present 1,150 pounds of milk, or 20 cans, are being shipped daily from the local station, nightly taken north by truck to be delivered in the city next morning. That is just one hun- dred and three more cans than when the station was opened. There are over one hundred shippers and the number is growing. Between six and seven hundred cows are estimated to be in the Snow Hill district. Guern- seys predominate.

Snow Hill cooling station district, which even is served by farmers in

Virginia, is the proud possessor of the best milk cooling houses in the Phila- delphia milk shed, and pictures have been taken of them for exhibition elsewhere as models of their kind. They are uniform, water cooled and the pride of the county agent, who declares that the milk industry, in his opinion, has brought much prosperity to the county. This is true, not only through the monthly checks, which form Worcester farmers only winter produce revenue, except from poultry, but through the animal fertilizer produced, mixed with bedding and straw that binds and enriches the soil, not only for this year, but for future seasons.

C. T. A. Report

THE Central Pennsylvania Guern- sey Breeders' Association finish- ed its sixth year, March 1st, 1930, with thirty-three whole-year mem- bers. There were 545 cows in the Association during all or part of the year.

The registered Guernsey cow, "Gol- dies Beauty of Ebensburg" No. 99829, ten years old, belonging to the Grif- fith Estate, has an average produc- tion of 17,121 lbs. milk and 726.4 lbs. butterfat for the last three successive years.

The results for the six year's test- ing are as follows:

| Year | Av. No. Cows | Lbs. Milk | Lbs. Fat |
|------|--------------|-----------|----------|
| 1925 | 188.99 | 6149 | 283.7 |
| 1926 | 436.49 | 6538 | 294.2 |
| 1927 | 429.17 | 6817 | 298.5 |
| 1928 | 525.86 | 7099 | 303.3 |
| 1929 | 438.73 | 7114 | 318.1 |
| 1930 | 432.14 | 7079 | 335.6 |

Twenty-five herds with an average of five or more cows exceeded an average production of 300 lbs. of butter- fat. A complete list of these herds follows:

| Owner | Breed | Lbs. Milk | Lbs. Fat |

Machine Milking is Here to Stay - and the

DE LAVAL Magnetic is the World's Best Milker

NO equipment a cow owner can buy offers more opportunities for saving time and labor, for making a hard job easy and pleasant, and putting more profit into his business than does a good milking machine. It gives these advantages twice a day, 365 days a year.

The De Laval Magnetic Milker has demonstrated its superiority in the field of machine milking in a striking way. The proven De Laval principle of master pulsation control, now accomplished by means of magnetic force, gives absolute uniformity and regularity in milking—every cow milked at the same speed, in the same way, at every milking. No other method of milking offers this all-important feature to a comparable degree. In simplicity of installation and operation, in sanitation, in ease of handling, as in the better job of milking it performs, the De Laval Magnetic is outstanding—a fact proclaimed and vouched for by thousands of users.

For perfect milking, the saving of valuable time and labor, and the substitution of pleasure and satisfaction for drudgery, the De Laval Magnetic Milker is distinctly in a

class by itself, offering new high standards of milking.

Outfitted for milking one to 1000 or more cows. Operated either by gas engine or electric motor.

The De Laval Utility Milker For the Low Price Field

The De Laval Utility Milker, designed for the lower price field, is a quality milker ideal for small herd owners with whom price is a limiting factor. De Laval Utility units operate on any single pipe line, a fact of im- portance to dairymen who want the advan- tages of De Laval milking, but who feel that they must retain a part of their original investment.

conditions*

ONE of the outstanding features of the Ford 1 1/2-ton truck is its capable performance. With an engine that develops 40 horse-power at 2200 r.p.m., and a 4-speed transmission which provides a great range of speed and power, it has the ability to carry heavy loads under difficult road conditions, and ample speed to shorten the distance between two points, with no sacrifice of operating economy.

The Ford truck will finish the work it is given to do, for it is strong and reliable throughout. A new spiral bevel gear rear axle, heavier front axle and spring, sturdy frame, steel-disc wheels, and the extensive use of special steels and fine steel forgings all contribute to its strength and long life.

Safety is increased by the new front brakes, which have been enlarged to

the same size as those on the rear wheels. Brakes are of the mechanical type, internal-expanding, and all are fully enclosed. Windshields are of Triplex shatter-proof glass.

Bodies of the Ford truck have been improved in appearance and comfort. They are strong, with ample loading space of carefully planned dimensions. The standard stake body and the platform body, equipped with grain-sides or cattle-racks, are widely used for agricultural purposes. Either the enclosed cab illustrated, or an open cab, can be supplied. Both are roomy and comfortable.

Let your Ford dealer show you how well this truck is adapted for hard work and long service, and at what low cost it can be placed and kept in operation.

Pyrox Pays Better than Home-Mixed Sprays, Grower Says

IN comparative tests, hundreds of successful growers have proved that Pyrox is not only easier and safer to use than messy home-made bordeaux mixtures—but is also cheaper. Pyrox-protected potatoes pay extra cash from extra yields of better quality.

The experience of Mr. C. S. Newcomer of Chambersburg, Pa., is typical of the results obtained by Pyrox users. He writes:

"This season I made a test comparing Pyrox with home-made bordeaux. Seed, fertilization, cultivation and soil conditions were the same. However, my yield on Pyrox-sprayed plots was 385 bushels per acre, an increase of 70 bushels over the plots sprayed with home-made bordeaux which yielded only 315 bushels per acre.

"Pyrox is easy to use—I need but a few minutes to put the material in the spray tank and I am ready to spray. There is no nozzle trouble. Pyrox stays on the vines through hardest rains, and goes farther. Because of its soft, smooth, creamy fineness Pyrox will go through small holes in the nozzle disc resulting in greater ease in developing and maintaining pressure.

"My Pyrox-sprayed potatoes will show, at \$1.00 a bushel, at least \$70.00 more per acre. They are more uniform in size, smoother and cleaner in appearance than those sprayed with home-made bordeaux."—C. S. NEWCOMER.

Gets 15¢ to 20¢ per bu. Above Market Price

Mr. H. C. Rineard, of York, Pa., writes:

"I raise large acreages of corn, potatoes, wheat and hay so I must make all my labor count. That is one reason why I like Pyrox—because of its ease of preparation and application

Mr. C. S. Newcomer of Chambersburg, Pa.

as compared with home-made bordeaux.

"This is my second year using Pyrox and I certainly find that it gives me the control of insects and disease on my potatoes, and also improves the quality. I have been getting an increase of 100 bushels per acre, and an average of 15 to 20 cents per bushel better than the prevailing shipping price for my Pyrox-sprayed potatoes."—H. C. RINEARD & SON—November 6, 1929.

At \$1 a bu., Mr. Rineard's extra profit obtained with Pyrox amounted to \$100 per acre! And this is in addition to the extra price obtained per bushel.

Pyrox kills bugs, controls blights, and other diseases, and stimulates plant growth. It is quick and easy to use. Sprays in a fine mist—does not clog nozzles. Sticks like paint to plants, even through severe storms. Now lower priced than in 31 years.

Write us for facts which prove that you can actually cut your production costs—get more profit from your potatoes—by spraying with Pyrox. Please mention your potato acreage.

Farm Facts and Fancies

By ALVA AGEE

THE receipt of a "chain" letter is far from complimentary unless one's name was chosen at random by a stranger. The presumption is that one is superstitious enough to be forced to keep the letter going through fear of some ill or hope of some gain. This letter was supposed to originate from some army man who fought in Flanders. I should be quite willing to incur any unpleasantness due to breaking the chain.

This particular form of silliness was in full swing quite a good many years ago and should be completely in the discard. It appears that it is not. Anybody breaking such a chain has the reward of strengthening his confidence that he has common sense. A foolish doubt on that score dogs some who keep up a brave front out in the world.

Curious Beliefs

I once heard a well-educated man affirming that research had convinced him that left-handed people are brighter than right-handed ones. Maybe so. There are many people of good judgment who keep in mind a lot of "signs" and "omens," and the combination of judgment and omens is a puzzle to me. I have known sensible housewives who would not undertake any new work on Friday because they believed the day to be unlucky. I remember a good dinner I got through willingness to be a guest invited at the last moment because there would have been thirteen at the table if I had not been there, and some would have been uncomfortable on that account.

A good business man once told me that he always found himself unwilling to put his right shoe on first, and he chose to follow as a mental urge directed. Of course it was only habit that led him to reach for the left shoe first, and it didn't matter because the right foot got just as good a fit in the remaining shoe.

Prejudices

One's judgment often is clouded by unreasonable prejudices. Racial prejudices have been back of many a war. If the reader will go over a list of acquaintances he probably will find some one he does not like at all, and yet could not assign any reason worth mentioning. A particular flavoring in a food, however slight, makes some people physically ill.

It is unfortunate that the common sense we may have must be hampered in its guidance of our lives by an assortment of prejudices for which we cannot find ground of justification. Some of us have heard of the man who railed at middlemen until the matter became an obsession. When critically ill he ordered his family to send for the undertaker instead of a physician, basing his demand on the fact that he never had had any use for middlemen.

Witches

A reader recently wanted something done about some witchcraft practiced in his neighborhood. He should accept the editor's statement that a witch cannot hurt any one who does not believe in it and its craft. That is a sure enough defense for a sensible person.

The matter of fairies is something else. When Maude Adams, in Barrie's delightful play Peter Pan, that ran in New York for years, would stop and ask the little children whether they believed in fairies, the response was whole-hearted. Older persons did well to remember that imagination is absolutely necessary to the seeing of fairies, and imagination is exactly what children possess in abounding measure and their elders do not. It follows that the only persons to decide such a question must be children. But the case of witches is clear enough—they are helpless in the affairs of those who know that witches do not exist.

Burning Organic Matter

It is a hard time for people in middle life. They do not surrender old beliefs readily, and farm science is giving us something new to consider right along. If we had a burning of organic matter was soil robbery. We knew the soil's need of vegetable matter, and when fire destroyed more all the surplus wheat there is the presence of the corn-borer compelled much burning of cornstalks and the Illinois Experiment Station is making a test of the fertilizing value of stalks when plowed down and stalks when burned.

The test of a single crop rotation of four years does not permit drawing of conclusions by the State, but the gain from plowing down has been only slight so far. I am wondering whether this Illinois corn soil is not naturally in much better physical condition and much better supplied with organic matter than the most of our eastern land, and so loss by burning is distinctly less than it would be on an eastern farm. Speaking without knowledge, I could readily believe the half the value of stalks plowed down in the mature and bulky organic matter added to the soil. Burning anything is probably poor business unless necessity compels.

Plant Pests

A reader writes: "You refer to the control of snails, ants and aphids. You not give me some additional information?" Well, the fight is continuous, but we keep the ants off our place, and so we put a preparation made for the purpose in tin cans that were also made for the purpose of moving the jars now and then and see new paths of ants. The poison is eaten and is carried back to the nest where the young are destroyed. Half-dozen of these jars, kept supplied with the poison, do the work for lawn and garden. Now and then new nest breaks loose, and we use kerosene for quick destruction, but a rule keep fairly free from ants.

Snails probably are even more persistent. In the evening the ground is moistened and we scatter a mixture manufactured for control of snails on plants and ground. It is only a attractive form of poisoned bait. Young snails may appear and the application must be repeated, and is best to remove any heavy foliage lying on the ground. We do not get all of this pest because later on we find more damage and again we poison.

A small hand-sprayer and nicotine sulphate, diluted according to directions, do the work for the garden. If applied before the leaves curl, the experience is that some of the lice escape destruction, and in a year or two another application is needed. We left our place for ten months last year, and life was a battle with the pests for six weeks this spring. Finally we put fear into their bones.

May Grade Honey

MANY beekeepers mistakenly believe that they are forbidden to use the United States Standard for honey unless they have special permission or unless a federal inspector has inspected and graded their honey. Says James I. Hambleton of the Bureau of Entomology, U. S. Department of Agriculture.

"It should be clearly understood," says Mr. Hambleton, "that any who complies with the U. S. grades for honey is entitled to use the United States grades and a grade stamp." A circular giving information on grading may be had on application to the Division of Bee Culture Investigations, U. S. Department of Agriculture, Washington, D. C.

The Yardstick

NOTICED an article on page two of your issue for January 4th, 1930, entitled "Censure and Approval" in which I heartily agree with you insofar as any public official is concerned. He should always have our earnest cooperation on any matter pertaining to public business.

I think Mr. Legge is doing his best. What he is doing, but I think that he is doing it in a way that will tend public money on perishable security is not the right way to help the farmer. There is plenty of room in the farmer's granaries to store all the surplus wheat there is in this country and the farmer generally knows when to sell without you or me or Mr. Legge telling him. But due to the conditions that exist today, the day of road building, school improvements and all other necessary causes for expense connected with what we call making a living for the farmer and his family, he must sell his wheat or any product from the farm as soon as it is harvested. He must then sell at prevailing prices in order to meet the loan.

Without Interest

If Mr. Legge and his Board would lend the farmer the \$500,000,000 the federal government has appropriated, and as much more as he needs on approved security, to be paid back to the government, say, at the rate of 1% on the hundred without interest, the farmer would have twenty years to help himself and the government would really be helping the largest and most important industry in the country without losing anything. It would start the wheels of industry in every line in this broad land of ours, and all other industries depend on the farmer who produces what we eat and wear. First come clothes and board and then other necessities and luxuries.

But think of the enormous amount of the producer is called on to produce in the form of usury, or what we call interest, to be paid to the non-producer for the privilege of using what we call money but is really our products of labor. Interest on money makes a short yardstick for the producer and a long one for the non-producer. Money loaned at six percent makes the non-producer's dollar worth 106 cents and the producer's worth 94 cents.

The Trouble

I think if you consider our national state, our county, our township, our church and our individual obligations you will see what is the trouble. It is not only the farmer but the whole nation.

Make a yardstick the same length for the rich and the poor and our problem is solved and our trouble is ended. Charles Leventry, Cambria county, Pa.

The fundamental error in all such thinking is to regard labor as the producer. Capital is a producer, as is labor. If it were not so our responsibility would be under the necessity of farming without any capital and without any equipment. The operation of capital and labor is essential to all production, and neither can continue to participate without the other. For convenience capital is expressed in definite terms of money and its wages in terms of interest or dividends, but such expressions do not affect the principle involved.—Ed.

Rely on the Popular Favorite—McCORMICK-DEERING "BIG BALL" TWINE

Treated Against Destruction by Insects

Guaranteed for Length, Strength, and Weight

500, 550, 600, and 650 feet to the pound

only manufacturer of both binders and twine has put the best quality it is possible to produce into every foot of every ball.

Uniform length means uniformity in thickness; there are no extremely light or heavy places that might cause the knoter to miss tying. McCormick-Deering Twine is correctly twisted so that it will not kink and snarl when running from the ball, and the original "Big Ball" winding with the Patented Cover makes this assurance doubly sure. This year it will not pay to take chances. Buy the twine that looks good, is good, and has been time-tried and found completely satisfactory—the old reliable McCormick-Deering.

ANSWER THEM and say you saw their advertisement in the Pennsylvania Farmer.

EVERY 4th Forkful of Long Hay

you feed
is
WASTED

THE same reasons that led you to turn from corn fodder to silage will sooner or later impel you to abandon the wasteful practice of feeding long hay.

Western farmers were the first to discover the advantages of hauling hay from the field, running it through a Papec Hay Chopper, and blowing it in a stack or barn. It enabled them to get full benefit from their legumes instead of buying so much costly grain. Chopped hay proved easier and cheaper to handle—increased the feeding value of their roughage as much as 35%.

Now, eastern dairy and stockmen are faced with the necessity of making their feed dollar stretch farther. They, too, are turning to chopped hay.

Many Advantages

You know that much of the roughage you feed out is wasted by the stock. Many feeders place this loss as high as one-third. But all the chopped hay is relished. Stock clean it up like grain. That means more milk—larger weight gains. One dairyman reports his herd produced

more milk on 32 tons of chopped hay than on 45 tons of the long.

It costs no more to put hay up chopped than it does the old-fashioned way. Three men feeding to a Papec Hay Chopper can pitch off a load in 10 to 12 minutes. No more back-breaking work in the mow. Chopped hay occupies just half the space—is less apt to spoil than long hay.

Two Machines in One

The same machine that chops your hay and blows it into the mow serves also as an efficient silage cutter. No alteration is necessary in moving the machine from one operation to the other. Alfalfa, clover, soybean and other hay, pea vines, and corn are all handled satisfactorily.

This Book Free

You'll want the facts and figures about this proven method that is rapidly revolutionizing hay feeding. We have evidence gathered from the experiences of farmers in all parts of the country, from Experiment Stations and feeding authorities. Write us for the free book, "A Better Way to Put Up Hay." Send for it now.

I WRITE this on Memorial Day, the one day on which every community in the North turns instinctively to the cemetery and pays tribute to the memory of those who served their time and have been laid away. As far as the community is concerned, the tribute is to those who have served their country in time of war and have responded to the last call. But in addition to this, every family turns its attention to a private plot and lays a flower on a mound or mounds under which a friend or member of the family lies in the last sleep.

I have been recalling today the incidents of Memorial Day, or Decoration Day, as it used to be called, that have happened ever since I can remember. The first one I recall was when, as a very small boy, I marched with my Sunday School in the parade to the old cemetery on the hill. The band and flying banners gave me a thrill such as I seldom have had in my later years. The spirit of the day and occasion was not heavy upon me as I recall it, but it was a great event, and I knew today, as I watched the boys in the parade, just what was passing in their minds.

I can recall the appearance of quite a company of middle-aged men wearing blue uniforms and unique caps marching steadily and firmly behind the band. There were several of them, but as time went on this company became smaller and smaller. Finally the few survivors rode in a carriage, and as I look back in memory this evening and recall what has happened since we left that community seventeen years ago, I am saddened to believe that when the concourse wound its way up to the old cemetery today not a single uniform in blue accompanied it.

As we watched the parade here this morning one blue uniform and the accompanying unique cap passed by in a sedan. The wearer is 88 years old.

But behind him was quite a good-sized company of young men wearing khaki suits and jaunty khaki caps. They stepped along briskly, a group not much younger than the company which wore the blue when I saw them the first time. I remember hearing my grandfather tell of bands of old soldiers who had lived before my time and had passed on. And as I watched the boys today I was impressed with the fact that every generation has had its company of men who passed through the harrowing experiences of war. Always there have been men who have had to offer themselves as sacrifices for their country's defense. And I turned to the little folks by my side—grandchildren—and fervently hoped that they might not be marchers wearing a uniform in a similar parade in the generation to come, or be in graves decorated by others because of war.

There were at least two notable events which happened on Decoration Day within my memory. One was what is known as the "Johnstown flood." At least the rain began on the afternoon of that day in 1889. The commemorative exercises had been conducted as usual in the forenoon, although it was cloudy and threatening. After dinner it continued to get darker and more ominous until it began to rain about three o'clock, as I recall it. Soon after it began to rain it was pouring. I do not remember seeing rain come down as it did at that time. The air was simply filled with water. And it kept up, all the rest of the afternoon and all night

long. At our place there was a big tin container with straight sides standing in the yard. Father measured the water in it the next morning and there was over eight and one-half inches in it! Two inches of water makes a big rain in this section.

On Memorial Day in 1892 Walter L. Main's show was scheduled to set up its tents in Tyrone, Pa. It had showed at a town in the Allegheny Mountains the day before, not far from my old home. The show people were asleep in their cars as the train descended the mountain, all unconscious of their danger. For some reason the engineer was unable to back the train. It was understood that he had asked for and been refused an extra engine, fearing that one could not handle the long, heavy train down the mountain. He was right. It was soon beyond his control, and after running wild for several miles over a crooked road, finally went over the bank at a sharp curve and piled up. And such a wreck! Several of us went over to see it in the afternoon, but I am sorry to this day that I did. Men and women, and animals from monkeys to elephants were killed or injured. Several wild animals were at large, while twenty-four of the finest of Main's horses lay in a row dead. The eight men and women who were killed, the only home most of them being the big tent of the sleeping coach, were buried nearby. For years, and maybe to this day for all I know, the survivors have paid fitting tribute to their dead comrades each Memorial Day.

Friendly Talks

By
Edgar L.
Vincent

IN the bank just outside one of my cellar windows grows a low bed of lilies-of-the-valley. The morning when I went down cellar discovered that one of these beautiful plants had pushed its way under the window sill and then made a sharp turn upward, rising several inches into the light.

I wonder why the little plant takes its course that way? It is dark under the window sill. The space is narrow and no moisture to cheer the tender flower. But the more I have thought about it the more I believe it is the warmth of the cellar that invites the plant to come in. I am very sure from signs I see at the base of the longest stem that soon a blossom will appear up in the light of the window. Outside none will have shown themselves yet. It is only because the warmth of the cellar that the lily-of-the-valley will hang out its pure white bell so long before any of the rest.

Now I know men who are just like that. They keep their farms in good shape, but their returns are not so great for some reason or other. They keep on planning and thinking and working, and by and by they creep in through the dark where it is warm, and there they blossom and add to the world's beauty.

Turning toward the warmth where is that warmth? If we look for it, we shall find it in the heart of every friend, in all of the experiences of life, in home, in the love of wife and boys and girls. But we shall not find it unless we look for it and are ready and willing to be good kind and gracious ourselves.

A Weed Made to Pay Profits

By C. D. GRAY

THE farmers in and around Parsons, Tucker county, West Virginia, have literally thousands of acres of rhododendron, azaleas and mountain laurel covering the mountain sides. From the time of the pioneer these plants have been nothing but brush and considered a curse by the farmers. To cut them off or to burn the areas on which they grew meant a bigger crop of plants, bushier and stockier than ever. There was but one recourse to get rid of them and that was the grubbing hoe well oiled with a force-fed system of elbow grease.

For years the farmers have seen commercial collectors visit Parsons and take away carloads of rhododendron, azaleas and laurel. They were glad to get rid of the plants at any price the collectors would pay. One to five cents a plant was the usual price. In addition there was the labor of collecting, which was usually done by local farmers or local labor. In the spring of 1929 it was suggested to these farmers that they could market these same plants cooperatively and build up a business for themselves. A meeting was called at Parsons of all farmers who had any one of the three plants growing in quantity on their property. A goodly number turned out and cooperative marketing was discussed with them. As usual some thought it a good idea, others said nothing; however, there were enough present who were willing to give it a trial. The result was the West Virginia Native Plant Growers' Cooperative Association. That's a lot of name.

Learned by Experience

The local men knew practically nothing about how these native plants should be collected and prepared for shipment. A superintendent with some former experience was placed in charge and organized the collecting and office work. But no one knew the trade and where to sell, so a nursery salesman from Pittsburgh was hired to sell on a commission basis.

Soon the orders began coming in and before the season closed the first Cooperative Native Plant Growers' Association ever to be organized in West Virginia had sold and delivered thirty carloads of rhododendron, azaleas and mountain laurel. Over eighteen thousand plants had been collected from the woods and hillsides and turned into cash. The growers received eight cents for every plant, large or small, which was sold. In addition they received more than twenty cents a plant for labor of collecting.

All infant industries have many difficulties to face and much to learn, and so did this group of native plant collectors. Not knowing what the trade demanded many plants were inferior in quality or method of preparation. A number of cars were rejected and others required adjustment before collection could be made. When the 1930 season opened these handicaps had been overcome. The requirements of the trade had been learned from bitter experience and the results for this year's collecting shows but one objection on quality of material and this objection was on fifty rhododendron six to eight feet tall that were not correctly staged in the order.

Only eighteen carloads were sold this year, compared to thirty for 1929; however, more than half were repeat orders from last year. Retail orders were taken this year for the first time and returned the growers handsome returns.

To insure a continuous supply and to increase the quality of plants unmerchantable material is being cut back and transplanted. This will provide plants of unquestioned value for the retail trade.

Data for this season, which have recently been compiled, show that 11,542 plants were sold for \$9,398. The cost of collecting and marketing was \$6,115.60, leaving a gross return of \$3,282.40. From this amount the West Virginia Farm Bureau Cooperative Association must be paid for distribution and collections. The remainder will go back to the growers in rebates.

The county agent of Tucker county, of which Parsons is the county-seat, states that this year's business is equivalent to sixty farmers marketing their products cooperatively from sixty droves of twenty-five sheep each. Quite a nice sum from lands which were mostly a burden from taxes levied annually.

Intermediate Credit

THE Federal Intermediate Credit Bank of Baltimore is quite different than any other institution lending money to farmers' organizations or indirectly to farmers through local lending institutions, such as banks—both state and national—agricultural credit corporations or livestock loan companies. In the first place, the 12 banks are housed with the 12 Federal Land Banks, and they have the same offices. The capital is supplied by the federal government, and the funds in addition to the capital which they loan are derived from the sale of short-term bonds or debentures to the investing public. Thus we have 12 banks without depositors, with the government owning the stock and the public supplying the funds by investing in its short-term securities.

In the seven years in which the banks have been operating, 92 farmers' cooperative marketing associations, with a membership of close to a million individuals, have borrowed directly from these banks, using warehouse receipts on staple agricultural commodities as collateral. Twelve of these associations have borrowed on wheat, 11 wool, 18 cotton, 10 tobacco, 15 canned fruits and vegetables, four alfalfa seed, three handling beans, prunes and olive oil, two each handling rice and honey, and one each broom corn, redtop seed, raisins, hay, Lima beans, evaporated milk, peanuts and other nuts, cheese, flax and barley. In addition, in the last year the Federal Farm Loan Board has agreed to loans being made on maple syrup and sugar and powdered skim milk. Loans on such

A beautiful rhododendron specimen used for foundation planting.

commodities, including renewals, have amounted to \$470,000,000 to date.

Farmers' cooperative marketing organizations have borrowed from 60 to 67 per cent of the current value of the commodities, and thus have been able to pass on to their members a liberal proportion of the value of the products at the time they have delivered them to the warehouses. Last year they loaned on 15 commodities approximately \$43,000,000.

The Federal Intermediate Credit Bank does not make loans direct to farmers. It would be a physical impossibility to do so. The Federal Land Bank of Baltimore covers not only the great state of Pennsylvania, but Maryland, Delaware, Virginia, West Virginia and through its branch bank, Porto Rico. It is, therefore, necessary for a farmer who wishes to get a loan for an agricultural purpose, namely for the production of agricultural commodities, to get in touch with his local banker or a credit corporation or livestock loan company. About 693 such local lending institutions have used the Intermediate Credit Banks since they were started; that is, they have taken the notes of farmers given for a six months period or more, the proceeds of which are to be used for an agricultural purpose, and discounted them with the Intermediate Credit Banks.

Farmers give their notes to the local institutions for all sorts of purposes. They wish to use the money to feed cattle, sheep or to purchase dairy cows, to buy boxes, barrels, crates, bags, fertilizer, pay for labor, and the thousand and one things which go into the making of crops on the farm. Lately, a good deal of credit has been extended to dairymen. Thus farmers frequently repay the local bank over a period of a year or more, agreeing to pay so much each month from their milk check. In the West, particularly, livestock loans are popular, both on cattle that are in the feed lot, on the range or held for breeding purposes.

There are two principal advantages to the farmer: (1) He is assured of sufficient credit at all times for his crop production and livestock operations, regardless of local conditions in his community affecting the supply and cost of credit, and (2) He is assured that his loan will not be called for payment until his crops and livestock are ready for market. Vulosko Vaiden, Pres., Federal Intermediate Credit Bank of Baltimore.

FROM LIFE

A MAN who advertised his well stocked farm for rent got so many inquiries that he decided to keep on farming, where he "has a steady job and can eat regularly." Many of his inquiries came from men who had sold out and gone into other business, where they had lost or spent their capital. They wanted to go back to farming and his announcement that little capital was needed attracted them.

DEAN RUTHERFORD

LET us lay a humble wreath on the grave of Dr. William John Rutherford, Dean of the College of Agriculture of the University of Saskatchewan. For a quarter of a century we have known and esteemed him as an enthusiastic but well balanced teacher and leader in agriculture. He was never gifted with a strong body, was a cripple in fact, but his earnestness and his abundant common sense overcame all physical handicaps and made him one of the most useful and influential men of his country.

STARTLING

A BOOK has appeared which says that the trouble with agriculture is not so much low prices as high costs; that there are enough farmers now to raise all the food the country needs; that efficient farmers can and do prosper; that agricultural depression will be overcome naturally if economic law is allowed to operate, and that relief enacted by law is improbable. This work is described as "startling," probably because it does not advocate some law or scheme to create prosperity regardless of conditions here and in the rest of the world. Have we become so used to the idea of artificial relief that the idea of reliance on economic law is startling?

BIG CATTLE SHOW

LANCASTER county, Pa., called by its citizens the garden spot of America, is the center of a great cattle feeding industry. Nowhere else in this broad land is soil fertility more esteemed, and consequently nowhere else is manure more highly valued. That accounts for the fact that Lancaster feeds to a finish more cattle than any other like area in this country. June 18 and 19 the tops of this year's feedyards will be assembled at the Lancaster stockyards for the annual Pat Cattle Show, the largest exhibition of commercial cattle in the East. We advise everybody interested in cattle, or in agriculture of any

kind, to go to see this Show and the country round about. And we will wager ten cents worth of good cigars that whoever does so, if not deaf, dumb and blind, will be the wiser for his trip.

THE GRAND TOUR

IF there ever was a day when farmers didn't know and didn't want to know about the farmers of other regions that day has passed. Nothing could give better evidence of the broad interests of country people than the hundreds of inquiries we receive from readers about the Pacific Northwest tour we are conducting this summer. Every day we get requests for reservations from those who welcome this opportunity to see how the other fellow lives out on the Great Plains, among the Rockies and Cascades and along the blue Pacific. We hope to be able to accommodate all who want to join us in our adventures in the Far West. However, first come, first served. We urge all who plan to go to make reservations at once.

CONFERENCE ON STABILIZATION

AMONG the features of the American Institute of Cooperation this year is a five-day conference on grain stabilization. It may take five days for "the members of the Federal Farm Board, the economists and the cooperative officials" to explain and try to justify the present plan of grain stabilization, but it should not take one day for real economists and business men to show its fallacy. Experience is even slower than a five-day conference, but ultimately it is going to show us that there is no stabilizer equal to a free and open market.

CHANGING TRANSPORTATION

FOR several years we have been required to make advance estimates of car-load shipments of agricultural products for a considerable area in four states. We have been interested in comparing these advance estimates with the actual shipments, and find in some cases a big difference between the two. In most cases this is due to a change in transportation methods, the truck carrying what the freight car used to take to market. In livestock, grain and mill feed the advance estimates have been fairly close to the actual shipments, but in perishable commodities overestimates have been the rule.

A NOTABLE DISCOVERY?

ACCORDING to press report Dr. Joseph Lignieres, a French scientist of high repute working in Argentina, has succeeded in isolating the germ of foot-and-mouth disease. If this report is correct he has done what bacteriologists have been trying in vain to do for many years. Dr. Lignieres expects to discuss the matter at the International Congress on Veterinary Medicine at London, where he will ask for a commission to study and test his discovery. The commercial value of this achievement can hardly be computed, nor can its effects on international trade be foreseen. For it is foot-and-mouth disease which keeps South American beef out of our markets and most European breeding stock out of our country.

NEW INFLUENCES

THE Russian government, which controls all business in that country, announces plans for the handling of about twice as much export tonnage as last year. Tonnage of what? Evidently not of manufactured products, for there is not enough of these for domestic use. The increase in exports now planned must be in products of Russian farms, forests and mines if in anything. The volume of agricultural exports from Russia or any country ordinarily will depend much

on the size of its crops, but today other considerations are having more influence than they had in the past. Russia will sell as much grain as possible abroad to balance its foreign trade. The same is true of several other countries which must export something for this purpose. The old rules do not wholly govern the present international trade. Financial necessity is producing policies, in both importing and exporting countries, which must have pronounced effects on our own export business. We have recently referred to two examples, Australia and Italy, but there are several others and their combined influence is not favorable to the broadening of our export trade in wheat or any grain.

OFFICIAL AND UNOFFICIAL

MAY 14 and 15 a committee of 15 apple growers, representing principal producing regions and their organizations, conferred with the Federal Farm Board at Washington. Two statements about that conference are before us. One of them is the official statement of the Board, which mentions a earlier meeting and leaves the impression that the apple growers expressed a desire for the Board to proceed toward a national apple marketing system. The other statement says that the apple growers (1) urged the Board not to impair the delicate machinery used in the present channels of trade; (2) that the growers advised the Board to take no definite steps toward a national sales agency for apples such as it has created for wool, cotton, grain, beans and livestock; (3) that the growers suggested that the Board's secretive policy is one cause of the public's apparent lack of confidence in the Board.

The Board's statement appears to be lacking in candor and designed to conceal rather than to express the facts about this conference. The unofficial statement reveals the principal facts, and there is no valid reason for suppressing them. In mentioning the Federal Farm Board's "secretive policy" did the apple growers have in mind its vast but secret operations on the grain market, carried on with millions of dollars of public funds?

RELIEF FROM RELIEF

ANOTHER farm relief measure went onto the scrap-heap last week when the United States Supreme Court unanimously decided that the Hoch-Smith joint resolution of Congress was "more in the nature of a hopeful characterization of an object deemed desirable than a rule intended to control rate-making." This resolution directed the Interstate Commerce Commission "in view of the existing depression in agriculture" to effect with the least possible delay "such lawful changes in the rate structure of the country as will promote freedom of movement by common carriers of the products of agriculture affected by that depression, including livestock, at the lowest possible rates, compatible with the maintenance of adequate transportation service." If the resolution meant anything it meant that freight rates should be made according to the current financial condition of the industry which shipped the commodity, a constantly variable and otherwise impossible basis for rate-making, and one that would destroy the fundamental purpose of the Interstate Commerce Commission, which is to see that rates are both reasonable and equitable, or not preferential. As usual the Supreme Court's decision is in line with common sense. It is also in line with the welfare of eastern farmers, who would suffer if distant producers were given highly preferential rates to eastern markets on the ground that they were not prosperous. That the established basis for rate-making is not to be upset by Congressional resolution affords some mental relief to eastern producers.

LAST week was a busy one for eastern Jersey breeders. The fourth annual spring show of the Jersey Cattle Association of New Jersey was held at Far Hills on Tuesday, June 3. Over 50 animals from the leading Jersey herds in the state were exhibited. H. M. Freer of Basking Ridge won the grand champion

Volunteer's Ursanne Buttercup. This aged cow was an easy winner over the other first place winners. Fern's Ashley Noble, a post entry yearling bull owned by P. H. B. Frelinghuysen of Twin Oaks Farm, took a grand championship ribbon. Competing against the grand champion cow were Volunteer's Daisy Chablis, first place winner of the class of cow under four years in milk and the class of cow under two years in milk and the class of cow under one year in milk and the class of cow under one year in milk and the class of cow under one year in milk.

P. H. B. Frelinghuysen won the second leg of the Merdale Challenge Cup, a cup offered to the exhibitor showing the three best animals from any herd. Once more a winner in this trophy. Twin Oaks Farm showed the best of-sire, get of Oxford Wexford, the best young herd consisting of one bull and three heifers which were under two years of age, and the best calf herd consisting of three animals under one year bred by the exhibitor. Not more than one bull could be exhibited in the calf herd class. D. Heald took first place with his herd one bull, two cows in milk, one yearling and one calf. Honors in the yearling herd class, consisting of three cows in milk, went to H. M. Freer.

On Wednesday, the day following the show at Far Hills, the Jersey men attended the 62nd Annual Meeting of the American Jersey Cattle Club which was held at the Pennsylvania Hotel in New York City. G. H. Hardenbaugh, who formerly for years was connected with the Mayo Foundation, that widely known institution which has helped to solve many pressing human disease problems, caused Bang disease. Samuel F. Cabbe of Fargo, North Dakota, was re-elected for a third year as president of the American Jersey Cattle Club. Directors elected were Congressman Elbert E. Brigham of Vermont; P. H. B. Frelinghuysen of New Jersey; Dr. W. H. Cabness of Athens, Georgia; and C. C. Dixon of Shed, Oregon. Lion's Lake, owned by Harry D. Iliff of Independence, Oregon, won a special silver trophy. This cow with 926 pounds of butterfat to credit holds the highest senior three-year-old record of all breeds. She is a winner of 10 medals of merit, two silver medals and has won a national Jersey record. As Mr. Iliff was unable to be present at the annual meeting the trophy was accepted in his behalf by John W. Coppini of Ferndale, California. Mr. Coppini is owner of the herd which holds the record for the highest average herd production tested for herd improvement Registry of the American Jersey Cattle Club. This average of 567.8 pounds of butterfat was made over a period of one year on five a day milking.

MANY of the western and southern delegates to the annual meeting were present at the 20th annual sale of imported Jerseys which took place at Morristown on Thursday. Fifty-five animals sold for a total of \$66,685, an average of \$1,212 each. This was an outstanding group of Jerseys imported by Mr. Spann and some of the individuals will be strong contenders in their class at the state and national shows this fall.

Pallas Polly's Spot, an exceptionally promising yearling animal for this fall, topped the sale when sold to Dr. W. Means of Brookfield, Mass., for \$2,200. Pallas Polly's Spot is a five-year-old cow which has been a consistent prize winner in the show ring on the Island of Jersey. Walter J. Minnins, Cold Springs Harbor, N. Y., purchased a promising show animal, May Queen's Julia, a young cow which made a show record before being brought to this country. This cow sold for \$5,300.

Many Springs Farm at New Centerville, Pa., was the heaviest buyer at the sale. They purchased

New Jersey Farm Comment

By G. W. HARRIS

ed ten animals. Paul Broaz, North Wales, was another Pennsylvania buyer.

New Jersey buyers included H. B. Cutting, Morristown; H. M. Freer, Basking Ridge; Twin Oaks Farm, Morristown; and J. M. Belcher, Far Hills.

THE opening of Burlington county's first auction market for the selling of farm produce which is to be operated by the Beverly Cooperative Growers' Association at Beverly has been postponed until about June 20. Earlier plans for opening were set for the first week in June for marketing the pea crop, but it was decided to wait until the first beans were ready for market so that the auction block would operate continuously during the rest of the season.

The Beverly auction has a decided advantage for success over some of the first auction markets

tained from records gathered throughout the United States has been checked for New Jersey conditions and practices by W. C. Krueger, the extension specialist in rural electrification at the College, and the figures were found to closely coincide.

Although the cost of electricity varies widely in different parts of the state, Mr. Krueger points out that the more current used each month the less will be the unit cost. For a monthly total of from 25 to 150 kilowatt hours, the cost for each kilowatt will vary between 20 and five cents. For a total of from 150 to 300 kilowatt hours a month the unit cost will vary between eight and four cents. And for usage in excess of 300 kilowatt hours the average unit cost will vary between four and one-half and three cents.

For the benefit of the housewife Mr. Krueger gives the following figures: "In the home, lights account for the consumption of from 15 to 50 kilowatt hours a month, with an average of 40. Water supply requires from two to ten kilowatt hours and averages three. The electric range will use about one kilowatt hour a day for each person in the family. The electric refrigerator will average 45 kilowatt hours a month throughout the year with a summer consumption of 75 kilowatt hours a month.

The washing machine uses four and one-half kilowatt hours a month, and the toaster, electric iron, percolator and waffle iron each consume about one-half a kilowatt for every hour of use. The curling iron, sewing machine, vacuum sweeper, and fan each consume from .1 to .3 of a kilowatt hour for every hour of use."

Costs for the various uses of electric power on dairy and poultry farms are also given:

"In the dairy, the milking machine uses from one and one-half to five kilowatt hours a cow for each month with an average of two and one-half kilowatts. Water supply requires from one to three and one-half kilowatt hours for each thousand gallons pumped and averages two kilowatt hours a thousand gallons. Electric water heating requires about one kilowatt hour for every two gallons of water heated to boiling. The dairy refrigerator consumes approximately one kilowatt hour for every hundred pounds of milk cooled from 95 down to 50 degrees Fahrenheit. Feed grinding takes from six to 30 kilowatt hours for each ton ground, depending mainly on the fineness of grinding.

"Poultrymen will require one watt hour a hen for each hour of lighting, and between one and two kilowatt hours for every chick electrically brooded for a six to eight-week period. Electric incubating takes about one kilowatt hour for every 49 eggs incubated in the mammoth type machine, and one kilowatt hour for every two eggs incubated in the smallest size incubators.

"When motors are used for the general farm chores, wood sawing requires from one to five kilowatt hours a cord, with an average of 2.3 kilowatt hours for 12-inch cuts. Hay hoisting consumes from .1 to .65 kilowatt hours a ton with an average of .4 kilowatt hours. Concrete mixing takes from .3 to .5 kilowatt hour with the average of .4 for each cubic yard of concrete mixed. Silage cutting requires between .5 and 1.2 kilowatt hours a ton of corn cut and elevated, or an average of approximately one kilowatt hour a ton when using a five-horsepower motor."

THE New Jersey Horticultural Society will conduct a 2-day automobile tour through fruit and truck growing areas of Delaware and Maryland on July 1 and 2. Professor A. J. Farley, secretary of the Society, announces.

The itinerary includes several visits near Dover, Delaware, center of an important fruit growing district, an over-night stop at Ocean City, Maryland, and a tour through the orchard and truck areas of Berlin and Salisbury, Maryland, and Bridgeville, Delaware.

C. B. Lewis, Riverton, is committee chairman for the tour, which is the first of its kind ever to be conducted by the State Horticultural Society.

What a hoon radio would have been to early pioneers!

The tractor is used to plant and to harvest the dairyman's corn crop, while the milking machine saves time and labor on many dairy farms.

Power on the Dairy Farm

By TUDOR J. CHARLES, Jr.

GASOLINE and milk have never been considered to have much in common and a few years ago power farming and dairying would hardly have been mentioned as principals in even the briefest sort of a partnership. Today, however, many farmers who control power capable of producing thousands of dollars worth of crops also milk a herd of cows—and like it.

Corn and alfalfa are to milk production what coal and pig iron are to the steel industry, and it is logical that power for producing cheaper feed should bring dairying to many farms, just as the steel industry was first attracted to Pittsburgh.

The whole change to greater use of power, both gas engine and electrical, has benefited dairying. First, feed is produced more cheaply, as we have noticed. Where two men were required in the field the greater part of the spring and summer, now one man with a tractor outfit can handle all of the former work.

It is easy to see how this affects the work connected with the herd. The extra man can give the greater part of his time to his cows. This will either insure closer attention, or cut down the expense of hired help. The day is past when any of us must forego having a good herd of milk producers, because they interfere with summer field work, or vice versa.

Time and Labor Savers

Around the barn and barnyard changes have come. Electricity or gas engine power will do a large number of tasks which formerly took up too much time, or increased labor costs. Feed grinding and mixing is one job which has been lightened by power. When one man is busy attending to all of the duties connected with the dairy, it is a great help to have the feed mill hooked up to an elevated bin, with a fan elevator for blowing the chopped material into a bin, so that he can let the outfit run without being on hand every minute to see that the hopper is filled and the ground feed taken away.

Because the dairyman of today must compete with his time against that of a tractor in the field, it is certainly essential that he give careful attention to the results of his own labor in the barn, just as he does toward his accomplishments in the field. He cannot afford to do the work which electricity or a gas engine will do for a few cents an hour.

As the dairy cow increases in efficiency and the operator's time becomes more valuable, a greater investment can be profitably made in equipment. The owner of a cow that in seven successive lactation periods produced digestible food material equivalent to the carcasses of 47 steers could well afford to house her in comfort and feed her to capacity. Whether a man owns one good cow or a hundred he will be well repaid for good care.

In housing the herd, successful dairy farmers find that ventilation should receive first consideration. Each cow gives off about five quarts

of water in her breath every 24 hours, and unless this foul air, heavy with moisture, is carried out of the barn by means of proper ventilation, vitality of the herd is lowered and the cows are less able to resist disease.

In a poorly ventilated barn, condensation of moisture on the walls and ceiling will be noticed. Where the ceiling is not tight, in an unventilated barn, quite often the moisture will rot some of the hay. Electric power is now being used in barns to carry off foul air and at the same time control the intake of fresh air. Being independent of weather conditions for successful operation a positive control is possible in any season.

A Closer Hook-Up

Cost of installing power ventilation is around half that of the older systems and cost of operation is low—about one cent per cow each day, or between three and four dollars a year for each cow.

In practically every monthly report, testers speak of the good work that automatic drinking bowls are doing for their owners. A recent report, typical of many, tells of a man who had occasion to disconnect one drinking cup and the cow that drank from this bowl decreased her milk flow six pounds daily. When water was again supplied she increased her daily flow to where it was before.

Several recent improvements on milking machines have made them increasingly useful to dairymen who wish either to increase the size of their herd without hiring additional labor, or to give more time to other jobs. One man of whom I know justified his machine for milking his herd of eight Holstein cows three times daily by pointing out that it worked for him in the same way as his general-purpose tractor, which makes it possible for him to handle his 80-acre farm and entire herd without hired help.

Electricity finds many uses on the modern dairy farm. Here an electric motor provides the power to fill a silo.

sible for him to handle his 80-acre farm and entire herd without hired help.

Indications certainly point toward a closer hook-up between power farming and dairying, or in a few years, power farming and dairying may be one more spare time, and more pasture and barn may be certain results of proper use of power equipment—both in the field and around the barns.

A Start in Soil Improvement

NOTHING gives me more pleasure than to be a boy get a start in life. A few months ago a neighbor's son, Rupert Cole, came to my house and asked to have a talk with me. The conversation had not gone far until I saw that my visit was anxious to become the owner of some land. He told me of four and one-half acres of wet land that his uncle owned that he wanted to buy.

I am always slow to advise any one to buy land until I have seen it, especially if the purchase must go in debt for it. This time soon came and the boy and I were going over this land. I was much surprised to find this meadow which in my boyhood days was dry and very productive was almost a swamp.

The first question asked by Rupert was: "Do you think this land can be tile drained?" I told him that it could be quite easily. The field was gently rolling which made drainage very easy. The second question was (and it was a very proper question), "How much will it cost?" This was not so easily answered. I saw that three and one-half acres of this meadow must be tiled. About one acre was on higher ground and did not need drainage. Rupert soon gave me to understand that if he undertook it he wanted to do it just right. Making a rough estimate of the rods of tile needed I concluded it would require 320 rods of tile, counting this at \$1.10 a rod would cost in materials \$350.

When I began to stake off the laterals I remembered that my good friend, H. B. Miller of Ohio, had recently told me that his drains were laid four feet apart, but now he was going to lay them six feet apart, but for the most part lying tile half way between them all would have been frequently told by farmers in Ohio that they could not handle their clover seed in the wheat in the spring for the reason that the ground was never dry enough. When we began to tile drain on Woodbine Farm we had as wet land as I ever saw in Ohio. We dried it so thoroughly that we could harrow the wheat in the spring, but we did it by laying tile from 20 to 40 feet apart. We laid off the laterals 30 feet apart and the reason that 320 rods of tile were laid on three and one-half acres.

In all probability Rupert's crop corn will not be very heavy, for it will take some time for the water coming to be opened up so the water can get through. Sometimes our first crop corn was very poor, but to start with this land of Rupert's is rich, and that on Woodbine was poor.

W. D. ZIMMERMAN

Milly Woodbridge's Trek to the Pacific

The Pioneers of the Peace River Valley

By C. A. Stephens

Copyright, 1930, by Copper-Harman-Stoum, Inc.

SYNOPSIS

Two New England families, who have gone to the Peace River country in Canada to make homes, find themselves in unfortunate circumstances when the railroad, on which they had based their hopes, is not built near where they have settled. One of the families, the Mastermans, moves away, but the other, the Woodbridges, remains in the vain hope that something will happen to create business for the sawmill they have built. The son and daughter advise following the Mastermans' example and go back to civilization while they still have enough money to make the journey, but the father refuses to leave his mill. At last, when it became evident that they could not live through another winter on the Peace river, and after their money had been spent, they started to walk across the thousand miles of wilderness, and mountains that stretched between them and the Pacific Coast. With a horse, a cow and later an Indian woman who joins them they cross rivers and forests in slow but determined fashion, living largely on game and fish. The extreme exertion together with wet weather seem to make the father's cough worse until one day he has a hemorrhage of the lungs, losing considerable blood before it stops. Later he seems much better and they go on with renewed courage. One evening the Indian woman, Pinky-Blue, while fishing encounters a grizzly bear and cub. Another night while they are encamped a moose suddenly appears apparently with the intention of attacking the old horse.

assisted him to move there from the tent. The sight of the fire and the warmth, with his daughter moving about, appeared to cheer him for a time. "You are a good housekeeper, Milly," he said. "I ought to thank Heaven for you—and I do," he added, pensively. "It's better than I deserve."

A little later, when Winthrop came in, his father said, "This is a fine house, my son. I don't see how you did it with nothing but an ax and a knife to work with! I'm proud of you."

"Well, dad," said Winthrop, looking round on his handiwork, "I could build a better one next time."

Pinky-Blue, too, was delighted with their new habitation. "Snow come, no cold," she said with a laugh of easy contentment. Nonetheless, she seemed to think it devolved on her to collect a stock of food. Squaws have that instinct as winter approaches, though forethought may be a better word for it. Every morning Pinky sallied forth with her long pole to hunt ptarmigan in the high

The Cheerful Plowman

CARRIED WATER TOO LONG

WHEN dwelling on the theme of passing laws to aid a movement or promote a cause I see a proneness there to duplicate a circus day event of early date. I well remember as a lad securing sanction from my dad to carry water for that mass, the bulky elephant of class. A ticket to the show, the main event, was what I sought with very best intent, and I was told that ticket would be mine if I would do the job superb and fine.

I lugged that bucket, heavy for a lad, with all the strength and speed I had, but every painful emptied in the trough the elephant would down without a cough. I carried water till my arms were sore, and still that bulging beast was wanting more.

The show began, I heard the band at play off in that tent which seemed so far away. I heard a distant voice announcing acts, proclaiming fiction and proclaiming facts, but still I carried water to the beast whose maw demanded seven barrels at least. At last, however, turning eyes away he quit his drinking, started chewing hay. Then to the ticket man at once I rushed.

"Ah yes, my lad, you've earned it well!" he gushed. I seized the ticket, started for the show. I went as fast as I knew how to go—but listen! All the crowd was filling out. The show was over, through, beyond a doubt. I had the ticket that I sought, Oh Fate, but it was useless now, it came too late! And off it is with laws we labor for, we talk and work, it seems forevermore, and then in time those laws indeed are passed. "We have the cure!" we cry. "At last, at last!" But soon we learn the law has come too late, it cures no troubles of the present date; there was a time it would have helped, no doubt, but now the ticket's nil—the show is out! Lawmakers often make me feel, you bet, I'm lugging water at the circus yet.

J. E. T.

grass along the flats by the lake. When it was frosty, the birds would be squatting dormant under the grass. Creeping forward like a fox the squaw frequently secured three or four at a few vigorous whacks. These she dressed off later and hung-up by the legs in a cottonwood tree, ten or twelve feet from the ground, to be out of reach of prowling animals. That tree was Pinky's larder and as days passed it became laden with strange fruit—meat in long strips and quarters, as well as ptarmigan. While at work on the hut, Winthrop had seen a caribou approach the river and had shot it. About that time, too, he shot a small black bear, very fat, which was prospecting among the crags back of the lake, apparently looking for a winter den.

Pinky's tree attracted prowlers. Just before sunrise, one morning, Milly, on looking forth from the cabin door, espied two foxes gazing up into it with great earnestness. She spoke to Winthrop and he, taking his gun, killed one of them. A few days after, he also shot a young elk. The squaw removed the bear skin and the fox skin with great care, and afterwards hung them up to dry. So pure was the air of this mountain region that game would keep and hides dry with little danger of spoiling.

Ever after the middle of September they had looked for snow; but cold as the nights had turned, no snow came save a few brief squalls, during the entire month of October. As late as the tenth of the month Pinky gathered blueberries and saskatoon at a brule on the hillside back of the flats. The berries had begun to dry on the bushes; and of this semi-dried fruit they gleaned two or three bushels.

DURING October Brighteyes got her own living in the grass flats; they hitched her out to graze each day in a new place. But how to provide for her after snow came was a serious problem. If they had possessed a scythe and rake, dry grass by the ton could easily have been cut and stacked for her winter fodder. Milly even attempted to cut bundles of it with her butcher knife, but found the task a slow and tedious one. To shelter the heifer from storms and later severe weather, Winthrop built and thatched a snug little shed at the end of their cabin nearest the river, whence she could be led to water. What Brighteyes most lacked was salt. They had but a small supply, not more than was needed for their own food; a spoonful a week was all that could be allowed her. Whenever they threw out water from a kettle in which meat had been boiled, she came eagerly to lick the ground.

At this time a hard and difficult task was occupying Milly's time, taxing all her ingenuity. Their clothes were falling to tatters, requiring daily mending. Pinky's old blanket coat, indeed, was now nearly gone. With twine and a darning-needle Milly had sewed the shreds together for her, about as long as there was anything left of it that would hold stitches. Something would have to be done for all of them; and in that extremity Milly hit on the expedient of cutting up their tent and making of the strong canvas gowns for herself and the squaw and also a suit for Winthrop. She measured them as well as she could with a string, in which knots could be tied, and afterwards, having spread the tent on the ground, cut out the garments from it with her scissors. That part she accomplished with no great difficulty; the tug of war came when she set about sewing the hard, stiff fabric. Despite all care on her part, she soon broke all her smaller needles and was obliged to resort to her one stout darning-needle and ball of twine.

Somewhere during the earlier part of their journey she had lost her thimble; forcing that large darning-needle through the canvas proved arduous work for fingers! For a week or more she toiled, and was sometimes near shedding tears of anguish and vexation. There was much trying on and not a few changes, since these new, white garments were designed to be worn over their other ragged clothes.

Finally they were done and ready to be donned. Pinky put on hers first and danced in it, then went out to call Winthrop to don his. They said the gowns looked pretty well; and that Winthrop's jacket and trousers fitted as well as could be expected. Poor daddy Freeman sat up in his couch to see them in their new raiment and could but smile at the ghostly figures they made. "But it is very appropriate," he said. "Nature puts on white when winter comes. The hares, the ptarmigan and the ermine all turn white with cold weather, and up at the pole where there is always snow even the foxes, owls and bears are white."

(To be continued.)

HORTICULTURE

Black Rot on Grapes

For about three or four years my White Niagara grapes have not done well. They bear but get the dry rot. It starts with a hard, black spot till it spoils the whole berry. Some of the berries have only the black, hard spot when ripe and some are all dried up. Will you please tell me what to do to stop the grapes from that dry rot and oblige a reader of Pennsylvania Farmer? W. F. Troutman, Jefferson county, Pa.

THIS is the black rot, a fungous disease. It is controlled by spraying with Bordeaux mixture about the time the second leaf shows, again just before the blossoms open, again when the berries are the size of shot, and once or twice thereafter at intervals of about two weeks, depending on the weather; the wetter the season, the more sprays are needed.

If you do not make Bordeaux you may buy at the drug store or hardware store one of the several patented forms; these are much more convenient for the home fruit grower, but somewhat more expensive. It is also well to remove and burn all "mummies"—the diseased fruit of last year—also infected canes, showing the canker spots. Commercial vineyards are plowed in early spring to bury the infected leaves and mummies.

S. W. Fletcher.

Plums Have Black Knot

All of our plum trees are badly affected with black knot. Some of them are already entirely dead, others having only a few dead branches, but all have some black knot on them. Is there anything we can do to save a few of the least affected ones? Practically all the plum and cherry trees on adjoining farms have black knot. Tioga county, Pa. L. F. Cobb.

CONTROL of this disease, which causes unsightly, black swellings on the limbs and twigs of plum and cherry trees, is very difficult. All cankers should be cut out in the autumn or early winter, before the winter spores develop. This may involve severe mutilation of some trees, especially when the knots occur on the larger limbs, but it is essential. In addition, the trees must be kept covered with a protective spray.

Bordeaux mixture is applied in early spring, before the buds open. This is followed by three or four applications of lime-sulphur, summer strength, the first just after the blossoms fall and thereafter at intervals of two weeks. This helps to control the brown rot of the fruit also. Unless there is concerted action by all the growers in the neighborhood the results may be disappointing.

S. W. F.

About Budding Peaches

I wish for information on budding peaches. I have read some back numbers of your paper which told how to insert the bud, but it did not explain how the bud was to be cut, what shape at the base so as to fit in the T-shaped cut. Lewis E. Hartshaw, Chester county, Pa.

THE common method of budding is shield budding. The knife is inserted about half an inch below the bud and is drawn up beneath the bud to a point about half an inch above it. The cut should not be deep—only deep enough to include a sliver of the wood. Some budders remove this, leaving only the bark, before inserting the bud in the stock, but this is not necessary. Thus the bud piece will be about one and one-half inches long and one-fourth to three-eighths inch wide, according to the size of the bud stick.

Extension Circular 103, on "Budding and Grafting," is being sent to you; this gives further details.

Moon Sign Planting

NOTICE in your edition of May 31st an article on "Moon Sign Planting" written by Chas. Bursee.

He speaks of different signs, viz., Cancer and Leo.

It is a little hard to understand his experience. There are twelve signs in the Zodiac, and those signs are all more or less governed by the moon.

I was taught by our old settlers to plant or sow either in the up or the down sign of the moon. In planting potatoes I noticed that when planted in the down sign my potatoes were deeper in the ground than those planted in the up sign.

In putting on a roof shingles put on in the up sign will curl up quicker

Here is gardening on a big scale. Family gardeners have their wheel hoes, seeders, harrows and various other tools, but production of vegetables for the big markets is rapidly being accomplished by larger horse and tractor-drawn equipment. The attached photograph is one of the largest in use, planting nine rows of vegetables in 14-inch rows. This picture was taken on the King Farms, Bucks county, Pennsylvania.

than when put on in the down sign. Those twelve signs which are governed by the moon are of vast importance, if the people would only notice or study them.

There is only one correct sign to cut hickory wood to keep the worms from eating or destroying your wood, that is to cut in the sign of the scales (or balance). That sign has neither flesh nor blood. All the other eleven signs are of a living nature.

Our old prosperous farmers made use of the moon's signs in many of their agricultural pursuits. They sowed their clover in March and the down sign of the crab with good results.

I think our friend and reader had better place more reliance on the almanac, and make it a study, where he can obtain quite a bit of knowledge concerning the signs and moon phases about planting crops.

Blair county, Pa. H. S. B.

Posts Sold with Free Ad

I HAD 500 locust posts this winter which I wished to sell. I made inquiries and offered them to likely purchasers without success. I even thought of holding a sale and auctioning them off but finally decided that I would try advertising.

I tacked a sign on the pile of posts. I confess that I felt a little ashamed while nailing on the poster and awaited results with some misgiving and trepidation. I don't know the reason for my feelings but I have a notion that all persons who place out signs feel as I did.

The posts were good, heavy seven-footers, hand split and arranged temptingly. Our farm had trees planted forty-three years ago along the three street fences. These locust trees had grown seventy feet high and some gave a post for every foot of their height, seventy. All the trees were in their prime and all had to be felled at about the same time. They were a nuisance, too. Storms broke off branches which the blinder and mower caught and falling limbs struck down crops. The trees were as ornamental and beautiful as they were damaging. Trees belong in woodlots,

clusters, woods, etc.; cultivated areas are no place for them.

On the back side of an election poster I painted in black, heavy letters, "500 Posts, For Sale." It was an attractive sign. I'm afraid if I wouldn't bother editors and readers with my writing, I would try to get them with my drawings. Don't call me vain, please.

Well, the posts and sign thereon were along a well traveled highway, but for weeks nobody seemed to be interested in posts. In about a month I sold the first load of posts. Before they were delivered I sold another and right away still another load. Then a man stopped and said, "I'll take a hundred." After him another

Phoma Rot of Tomatoes

PHOMA rot of tomatoes, also known as stem rot, black rot and Phoma leaf-blight or stem-blight has proved a serious obstacle to tomato growing in the winter trucking areas, the U. S. Department of Agriculture has found. It reduces yields or makes tomatoes unsalable. Sometimes this fungous disease destroys a whole crop, says Department Circular 219-C, "Phoma Rot of Tomatoes," published by the U. S. Department of Agriculture. To reduce losses from Phoma rot, plant disease-free seeds, rotate crops, and take care to prevent cutting or bruising the fruits. These are effective in limiting the damage, but no satisfactory method of control or eradication is known, say the authors, George K. K. Link and F. C. Meier. Department Circular 219-C may be obtained free from the U. S. Department of Agriculture, Washington, D. C.

Not Too Late

JUNE is not too late for sowing some annual flowers which will produce bloom profusely before the frost cuts them down, suggests Victor H. R. extension floriculturist for the Ohio State University.

Ries suggests a dozen plants which if sowed now will provide color in the home garden late in the summer. They are Candytuft, Calendula, Calliopsis, Dimorphotheca, Cypripedium, Cornflower, Poppy, Mignonette, Portulaca, Phlox, Alyssum and California Poppy.

Food for Cantaloupes

NEW JERSEY can regain her enviable position as a producer of high quality cantaloupes by supplying the crop with liberal amounts of available plant-food, and spraying to prevent outbreaks of the leaf disease so prevalent in this state. This is the opinion of C. H. Nisb, New Jersey extension specialist in vegetable growing, who recommends the application of a fertilizer mixture consisting of 100 pounds each of sulfate of soda and fish meal to an acre of cantaloupes.

Garden and Truck Crops

By GILBERT S. WATTS

YESTERDAY I spent about two hours strolling around my farm and using a simple little outfit for determining soil acidity. I began in a field that is being planted in cabbage today. In the center there is an irregular area of a soil type different from that making up the remainder of the field. This I found to be entirely too acid to produce a maximum crop of cabbage. Unquestionably the small expense of liming will be returned many fold.

In fields that include several soil types variations in lime requirements are quite likely to exist to a degree which the grower of intensive crops cannot afford to overlook. A two-dollar outfit that is so easily understood that any one can use it eliminates all reasons why a gardener should guess about this important matter. (Details will be furnished interested persons on request.)

IN April, through a misunderstanding, a very heavy drag that we have found an unexcelled implement for leveling rough plowed land was taken over a small acreage that had received its application of fertilizer. As a result the additional leveling that was accomplished moved some of the fertilizer along with the soil. Now the crops growing on what were slight bumps or elevations are distinctly inferior to the run of the field. More I am convinced that great care should be exercised to insure perfectly even applications of all fertilizers.

THE harvesting of strawberries has begun. Peas, beets, beans and other vegetables will be ready in rapid

succession. Day by day labor requirements are likely to increase. It will be a great advantage when the summer rush is at its peak if hoeings, thinnings, weeding and plantings have been previously planned through to a finish.

LATE cabbage planting time is the largest yield I ever secured was from a field planted June 3. Of course plantings made ten or twelve days later are likely to produce late-keeping heads. We began planting today, June 3rd, and shall continue intervals to July first. All the intended acreage has been plowed and worked down several weeks to insure ample reserve of moisture.

RAPID growth, watchfulness in the attainment of marketable condition and prompt harvesting are required to put out first-class radishes. The quality in this vegetable is almost exclusive as with strawberries and corn. In hot weather button radishes that are at their best one day are unfit for a discriminating market hours later.

THE extreme perishability of strawberries sometimes creates marketing difficulties for both large and small growers. Judicious use of "local reader" advertising is a potent means of increasing sales of berries right at the farm. The preservation of quality which goes with such direct selling both protects the grower from spoilage and encourages the consumer to greater use.

PATHFINDER

The Quality Tire
Within the Reach of All

"Buy it," says your own good judgment . . . "Buy it again," says your speedometer

YOUR first look at a Pathfinder tells you it's a tire to command respect on any car.

You see strength and toughness and traction written all over its husky tread—you see comfort and cushion in the generous fatness of its sidewalls.

You don't have to read the greatest name in rubber on those sidewalls, to know it's a real tire by every standard. It probably doesn't surprise you a bit to learn that the body of this tire is built of the famous cord material, Supertwist.

But you will be surprised to learn the price—because it is so low that few tires of any kind can beat it. Alert Goodyear dealers feature Pathfinder prices—they know that's a great way to win customers and friends.

THE NEW DODGE SIX

The new Dodge Six with its big roomy body is a worthy example of every fine characteristic for which Dodge cars have ever been noted. It is impressive in size and comfort, astonishing in ability, appealing in beauty. It has the safe, silent Mono-Plate Six Body and 4-wheel internal-expanding hydraulic brakes. Yet it is the low priced Six that Dodge Brothers ever have offered.

THE NEW DODGE EIGHT-IN-LINE

The new Dodge Eight-in-Line establishes an entirely new measure of fineness for popular-priced eight-cylinder cars. It reflects a quality of performance, a quality of engineering, a quality of beauty and comfort that carry Dodge Brothers traditions of dependability to the highest attainment of Dodge Brothers history. At its surprisingly low prices, it obviously represents a value that is sensational.

DODGE BROTHERS SIXES AND EIGHTS

UPHOLDING EVERY TRADITION OF DODGE DEPENDABILITY

The Story of Woodbine Farm

By W. D. ZINN

(Continued from last week.)

CHAPTER XVII

IN 1904, having sold a half interest in another farm we had bought during the eighties, we decided that if we were ever to enjoy a new house the time had come to erect it. Plans were studied and the kind of house was agreed upon. During the summer a very comfortable house with ten rooms, including the pantry and bath, was erected. A basement was put under the entire building. A hot water system of heating was installed. An acetylene lighting system was also put in the house, the electric system not having been introduced at that time.

When it became necessary, on account of the failing health of my wife, for us to leave our comfortable home, a neighbor said, "What a pity it is that you ever built such a good home since you are now going to leave it." No pity at all! We lived in it seventeen years, and it was worth to us in pleasure all it cost. It is true my wife's health failed, but she might not have lived the seventeen years if we had not had the house. It was a home that others admired.

from the ground. The ram landed on the floor making a thundering noise. No sooner had he landed than he righted himself on his feet and began to run about the room. In doing this, he turned over the table on which was standing a large lamp filled with kerosene.

The two teachers were soon out of bed and into the hall in search of the rascals who had caused the trouble, but the boys were fleet-footed and were soon in their rooms apparently sound asleep.

Our room happened to adjoin the room occupied by the two teachers. One of them was soon demanding admission into it. This was granted by my room mate. During all this confusion I was sound asleep and even the questioning of the teacher as to whether I had heard the racket the sheep had made did not arouse me. It was little wonder that he suspected that I was acting the part of an opossum. His suspicions being aroused, he went on the outside to a window of our room which was hoisted to its limit where he thought he saw foot prints which had just been made.

Accused

The president was in his study room at five o'clock every morning. That morning he had an early visitor in the person of the teacher who had gained an entrance into our room. As we afterward heard, he told the president that I was the guilty one and that he could prove it.

After breakfast the president sent for me to come to his study. I obeyed the summons. I knew if we went into an investigation of the matter it would cause me to lose some time from my studies and I proposed to the president that if he would call in a notary or a justice of the peace, I would swear that I knew nothing at all about the affair. I had hoped this would put an end to the affair so far as I was concerned. But it did not. One student after another was interrogated as to my whereabouts prior to midnight.

The sheep was thrown into the room at midnight on Sunday. The questioning and cross-questioning continued until Friday morning when I was again summoned to appear in the study of the president. He told me that he had made a thorough investigation of the matter and that he was convinced that I was guilty of the crime and he further stated that he would expel me that morning from the school.

Exonerated

After leaving the study I went to the room of my life-long friend D. W. Shaw, who was also a teacher in the school. When I advised him as to what would happen in chapel that morning he said, "He will not do anything of the kind," and he went at once to the study of the president and told him that he was about to take a step that would ruin the school. Mr. Shaw knew that a contract had been signed by about 75 students agreeing to leave the school if I was expelled. He told the president of this agreement.

I was again invited into the study. The president said he had changed his mind and would not expel me. Perhaps I should have let it drop at that, but my ire was roused. I had lost an entire week's work and had been shamefully treated. I said: "I am going to leave unless you go in to chapel this morning and publicly announce that I have been fully exonerated from any charge pertaining to the putting of the ram into the College building." This he did and the matter was soon forgotten.

Teachers Unpopular

These two teachers had the dislike of the student body who took pleasure in annoying them in every conceivable way. In the flock of sheep, to which reference is made above, there was a ram that weighed probably 250 pounds. A group of the boys thought it would be fine sport to catch this ram and put him into the room of these two teachers. It was midnight. Everybody on the campus was sound asleep except seven boys and a few confederates who were in their rooms nearby waiting developments.

The window through which the sheep was thrown was several feet

LEADCLAD ROOFS

BARN READY?

Your crops will soon be ready for the barn—is your barn ready for your crops?

If the barn roof leaks or is not fire and lightning proof you're taking the short end of a gamble with OLD MAN WEATHER, on your whole year's work.

If the barn needs a new roof, put it on now. If you want that roof to last, make sure you use LEADCLAD. Leadclad is rustproof, fireproof, lightning proof, and outlasts two or three ordinary metal roofs.

If the roof just needs a little patching here and there to make it weatherproof, do the job with LEADCLAD sheets. In this way you will learn, as thousands of other farm folks have, just what LEADCLAD'S heavy protecting armor of Pure Lead means to you in dollars and cents saving.

Ask your LEADCLAD dealer today to tell you about the new low prices on LEADCLAD SPECIAL farm roofing and LEADCLAD EXTRA HEAVY farm roofing. They're made for you.

The Story of Woodbine Farm

By W. D. ZINN

(Continued from last week.)

CHAPTER XVII

IN 1904, having sold a half interest in another farm we had bought during the eighties, we decided that if we were ever to enjoy a new house the time had come to erect it. Plans were studied and the kind of house was agreed upon. During the summer a very comfortable house with ten rooms, including the pantry and bath, was erected. A basement was put under the entire building. A hot water system of heating was installed. An acetylene lighting system was also put in the house, the electric systems not having been introduced at that time.

When it became necessary, on account of the failing health of my wife, for us to leave our comfortable home, a neighbor said, "What a pity it is that you ever built such a good home since you are now to leave it." No pity at all! We lived in it seventeen years, and it was worth to us in pleasure all it cost. It is true my wife's health failed, but she might not have lived through seventeen years of such happiness. It was a home that others admired.

from the ground. The ram landed on the floor making a thundering noise. No sooner had he landed than he righted himself on his feet and began to run about the room. In doing this, he turned over the table on which was standing a large lamp filled with kerosene.

The two teachers were soon out of bed and into the hall in search of the rascals who had caused the trouble, but the boys were fleet-footed and were soon in their rooms apparently sound asleep.

Our room happened to adjoin the room occupied by the two teachers. One of them was soon demanding admission into it. This was granted by my room mate. During all this confusion I was sound asleep and even the questioning of the teacher as to whether I had heard the racket the sheep had made did not arouse me. It was little wonder that he suspected that I was acting the part of an opossum. His suspicions being aroused, he went on the outside to a window of our room which was hoisted to its limit where he thought he saw foot prints which had just been made.

Accused

The president was in his study room at five o'clock every morning. That morning he had an early visitor in the person of the teacher who had gained an entrance into our room. As we afterward heard, he told the president that I was the guilty one and that he could prove it.

After breakfast the president sent for me to come to his study. I obeyed the summons. I knew if we went into an investigation of the matter it would cause me to lose some time from my studies and I proposed to the president that if he would call in a notary or a justice of the peace, I would swear that I knew nothing at all about the affair. I had hoped this would put an end to the affair so far as I was concerned. But it did not. One student after another was interrogated as to my whereabouts prior to midnight.

The sheep was thrown into the room at midnight on Sunday. The questioning and cross questioning continued until Friday morning when I was again summoned to appear in the study of the president. He told me that he had made a thorough investigation of the matter and that he was convinced that I was guilty of the crime and he further stated that he would expel me that morning from the school.

Exonerated

After leaving the study I went to the room of my life-long friend D. W. Shaw, who was also a teacher in the school. When I advised him as to what would happen in chapel that morning he said, "He will not do anything of the kind," and he went at once to the study of the president and told him that he was about to take a step that would ruin the school. Mr. Shaw knew that a contract had been signed by about 75 students agreeing to leave the school if I was expelled. He told the president of this agreement.

I was again invited into the study. The president said he had changed his mind and would not expel me. Perhaps I should have let it drop at that, but my life was ruined. I had lost an entire week's work and had been shamefully treated. I said: "I am going to leave unless you go in to chapel this morning and publicly announce that I have been fully exonerated from any charge pertaining to the putting of the ram into the College building." This he did and the matter was soon forgotten.

Teachers Unpopular

These two teachers had the dislike of the student body who took pleasure in annoying them in every conceivable way. In the flock of sheep, to which reference is made above, there was a ram that weighed probably 250 pounds. A group of the boys thought it would be fine sport to catch this ram and put him into the room of these two teachers. It was midnight. Everybody on the campus was sound asleep except seven boys and a few confederates who were in their rooms nearby waiting developments.

The window through which the sheep was thrown was several feet

Your Greatest Vacation

PENNSYLVANIA FARMER Tour

JUST imagine yourself and your family thrilling to the riot of color and awe-inspiring greatness of Glacier National Park—the shining silver mountains, the Blackfeet Indian pow-wow—the wonderful 3-day stay in famous Yellowstone National Park. This is but a part of this wonderful tour.

Your friends and neighbors from right here in your own county and state are planning to go this year. Get ready to go and enjoy this trip of a lifetime with them. Tour starts July 26—back home August 10.

LEADCLAD ROOFS

BARN READY?

Your crops will soon be ready for the barn—is your barn ready for your crops?

If the barn roof leaks or is not fire and lightning proof you're taking the short end of a gamble with OLD MAN WEATHER, on your whole year's work.

If the barn needs a new roof, put it on now. If you want that roof to last, make sure you use LEADCLAD. Leadclad is rustproof, fireproof, lightning proof, and outlasts two or three ordinary metal roofs.

If the roof just needs a little patching here and there to make it weatherproof, do the job with LEADCLAD sheets. In this way you will learn, as thousands of other farm folks have, just what LEADCLAD'S heavy protecting armor of Pure Lead means to you in dollars and cents saving.

Ask your LEADCLAD dealer today to tell you about the new low prices on LEADCLAD SPECIAL farm roofing and LEADCLAD EXTRA HEAVY farm roofing. They're made for you.

THE YOUNG PEOPLE

Thrilling Adventures

I AM going to tell you my most "Exciting Adventure."

One night a bunch of us girls and boys were coming home from a party. It was a very dark night and on the way home we had to pass a cemetery. The day before one of our neighbors died and the men had dug the grave in preparation for the funeral the following day.

The crowd bet that I wouldn't go across the cemetery, pass the open grave, and come back to them on the other side. As I was never much afraid in the dark I told them I could do it.

So boldly and fearlessly I started toward the open grave, but when I was within thirty feet of the grave I heard something rattling as if stones were dropping in the grave. As I drew nearer I saw something white bobbing up and down in the open grave.

I was so frightened that at first I could not move, but at last I started and oh! how I ran back to where the others stood and breathlessly told them what I saw and heard.

They did not believe me but finally

Doris Judy, Virginia

hot and poor Bob strained at the traces, puffing heatedly. After following the road that led up hill through the woods a great distance we arrived in the clearing. But alas, there was still a very steep hill to surmount before we could reach our destination. I felt the tension as Bob tugged and pulled under his heavy load.

Before I go any further, I must tell you that at the foot of the hill was a pile of logs strewn apart from one another. These were our salvation, as you will later see. As the poor horse pulled and strained suddenly the traces snapped and my father was pulled after the horse along the ground as the frightened Bob ran away. With a breath-taking gulp of terror we rolled back down the hill in the swaying buggy. Presence of mind in that horrible instant came to the mother of Lillian and Anna. Without a thought to personal safety, she leaped from the buggy and caught hold of its careening sides. Somehow she changed its course, how, could never be told, and with a swift turn lodged its wheels in the logs and it came to a sudden halt.

Pennsylvania. Mary V. Kundra.

We Would Rather Be--

IF I were not myself I would rather be my grandmother. The reason I would rather be Grandma is because she is always smiling and never scolds when I spill my jam or step in one of her flower beds. It would be nice to encourage people with a word of kindness like Grandma can.

And then what delicious pies and cakes Grandma can make. Oh! Gee! If I was Grandma I would bake and bake pies and cakes and then I would

A Cure.—Frank Hartl, Pennsylvania

Laird Wise, Maryland

eat and eat, oh, I believe I could eat them forever, but I would divide with some of my playmates who like so well to go with me to Grandma's house.

Don't you think you would like to be her, too? Lenna Brannon. West Virginia.

IF I were any one else than myself I would rather be Thomas Edison because he is a great man.

Some reasons why I would rather be Thomas Edison if not myself are: first, because I would be a great inventor; second, I would be an intelligent man; third, I would be a man who had done much for his country, and, lastly, I would have much money.

Dwight L. Wick.

Little Folks' Corner

A Discontented Boy

(Continued from last week.)

As they left him Mother said, "Have a good time, dear. There are lots of boys and girls around here to play with, and a nice playground right across the street. If you like it better here than at home, Auntie said you may stay and go to school all winter. Would you like that?"

Kenneth didn't answer. The tears were about to come as he realized they were leaving him. There was so much noise coming from the playground across the street he felt a little confused.

Such a long ten days! For two days he had a wonderful time on the playground. But soon he grew tired of so many around all the time, and the sliding boards and see-saws were not so much fun as he had thought. He wanted to dig in the ground and make mountains and tunnels, and he wanted to run through fields with Dickey and his dog, and he wanted to fly his kite. But his aunt had only a tiny, cement back-yard and her front porch went right onto the street. He could not sleep in peace at night for the jangle of the street cars.

Exactly at the end of ten days Kenneth's father came for him and there was a very happy reunion on the farm. Dickey danced and shouted, and Kenneth just ran and ran about the place, so glad was he to get his feet on the ground again. There were so many things he wanted to do, he couldn't do them fast enough.

Mother wisely asked no questions, but she noticed a big change in Kenneth. He no longer fussed and complained when she went to bring him

from school. He was glad to play with Dickey and his many playthings at home. Lucretia K. Mammel.

Now You Tell One

THE May contests brought in so many letters it will keep you busy for weeks reading the exciting adventures some of our readers had. And wait until you see the cartoons! The kicking cow and the balky mule will give you many laughs.

June is a hot month and a busy one on the farm, so we'll have something light and easy. Here they are.

1. Send a poem, story, adventure or free-hand drawing about the Fourth of July. Send something that will be suitable for the Young People's Page for our special July Fourth page. All contributions for this must be mailed before June 21st. There will be six fine prizes, including flags and a holder for your automobile.

2. Cartoon on "The Back-Seat Driver."

3. Prizes for the best "Original Joke."

Be sure to sign your name and address plainly. Address: Young People's Editor, Pennsylvania Farmer, 7301 Penn. Ave., Pittsburgh, Pa.

PASSING EVENTS IN PICTURES

1

2

3

4

1. The first television "talkie" was recently presented successfully in a large theater at Schenectady, N. Y. On either side of the six-by-seven-foot screen are the loud speakers.

2. Escorted by Captain L. F. Hodges, commanding officer of the Salt Lake City, President Hoover and party which reviewed the Atlantic fleet off Hampton Roads, made a tour of inspection of the cruiser, which was the reviewing ship.

3. Photo shows the beautiful carving of "The Nativity" by John Angel over the Amsterdam Avenue entrance to the Cathedral of St. John the Divine, in New York.

6

4. The latest portrait study of John Masfield, the new poet laureate of Great Britain, who was received by King George at Buckingham Palace. A large crowd gathered outside to see the man, once a hobo and formerly a New York saloon porter and sailor, who had risen to such eminence in literature as to earn the highest mark of recognition from royalty.

5. The odd lookout cabin located at the top of a 100-foot fir tree near Hoquiam, Washington, was built by the forestry branch of the U. S. Indian Service. On a clear day it is possible to locate fires at a distance from 35 to 40 miles.

6. The sloop "Yankee," one of the four yachts vying to defend the America's Cup, during her first sail on the placid waters of Massachusetts Bay.

Farmer's Business Letter

COPIOUS rains have blanketed the midwest this week, and in some places the moisture was much needed. The result is a much improved agricultural situation. However, business conditions show no important gains, in fact steel has taken a sharp drop recently. Farm product markets therefore continue rather lifeless, though without further important price declines.

Farm prices are holding pretty well at the lower level now prevailing. The more expensive foods are hit hardest, notably beef, with a variety of competitive foods available at less cost. Hot weather this week has had some effect on meat consumption.

Wheat Problems

The winter wheat crop will total 544,000,000 bushels, according to the average of the reports of statisticians of standing in the grain trade. This figure compares with an official forecast of 525,000,000 bushels a month ago and a final crop last year of 578,000,000 bushels. The same reports put the spring wheat crop at 257,000,000 bushels, against 228,000,000 last year.

The carry-over of old wheat is put at 270,000,000 bushels, according to a government estimate for July 1, the end of the present crop season. This is about one-third of last season's production, and is said to be the largest carry-over on record. The first of the new wheat will soon be on the way to market. Another factor in the situation is the high wheat tariff being levied by European countries.

A compilation by Nat Murray, Chicago statistician, shows that all foreign import duties reduced to the wheat equivalent would have made a total tariff of \$16,000,000 in 1924, and \$182,000,000 in the 1930 basis. Nearly every European country has raised a duty wall against grain imports.

The Canadian pool is reported as having moved considerable export wheat lately, at prices said to be well under quotations in this country.

That the Farm Board's grain agencies will be confronted by difficult problems in connection with this year's wheat crop is readily recognized. However, George S. Milnor, president of the Grain Stabilization Corporation, has given out a statement assuring millers and farmers that while no attempt would be made by the government to "peg" or fix prices of grain, the stabilization corporation was ready to insure what it regarded as fair prices.

Grain prices showed practically no net change for the week. The situation is such that neither side of the market is able to gain the ascendancy, due mainly to Farm Board influences.

Hogs Show Strength

The run of hogs was moderate this week—550,000 at eleven points, against 504,000 last week, 570,000 a year ago and 657,000 two years ago. The market showed strength all week, and the average price for the week was \$10.20, a gain of a dime over last week and only 45 cents under a year ago.

Average weight of hogs at 237 pounds compared with a five-year average of 242 pounds for the same week. Feeling in packing circles seems to be veering to the strong side of the market, based on supply expectations. This showed in the futures market

where another gain was recorded. Light hogs for July delivery sold at \$10.50 and for September at \$10.40. Medium weights sold at \$10.40 for September delivery. These prices are 5 to 15 cents higher than last week. The Live Stock Exchange announced this week that in response to numerous inquiries regarding December delivery trading in hogs for December delivery would begin June 28. Already orders to buy or sell December hogs are in the hands of brokers and "all indications point to a large volume of business."

There is more than the usual interest in the size of this year's "June run" of hogs. It hasn't started out very auspiciously. The opening week of the month shows only about 550,000 hogs at eleven points, the smallest June opening in more than ten years.

The sow run isn't as yet under way. It is late. When it starts it will make some difference in receipts.

The report of the spring pig crop will be out shortly, and it is being awaited with interest.

Break in Lambs

Receipts of sheep and lambs were large, and there was a price setback following several weeks of gains. Lambs were off 75c to \$1.50, and sheep even more. Top lambs brought \$13.50 early in the week, this price for spring lambs, the only lambs now quoted. Last year's lambs are now quoted

as yearlings, the change in the quotations being made this week.

Chicago had 72,500 sheep and lambs this week, against only 53,000 last week and 59,000 the same week last year. Southern lambs made up a good share of the supply, there being 16,000 of them on the market against only 1,500 last week, while the California run totaled only 15,000 against 20,000 last week. The first lambs from Washington and Idaho were also here.

It promises to be a big season for lambs, the southern run to date being the largest in several years, and western states promise big shipments from now on. All of which is not encouraging from the standpoint of future prices.

The usual summer break hit the aged sheep market this week, ewe prices at the close being lowest of the year.

Cattle Lower

The cattle market opened in rather promising fashion this week, but took a turn for the worse almost at once and closed 50 to 75 cents lower. Yet in view of the run it didn't do so badly, for the supply here totaled 51,000 head, 8,000 more than last week and the largest week's supply so far this year. Furthermore, the increase was made up largely of steer beef of some quality, and the greatest decline in the market was on the top end.

Receipts of cattle so far this year at leading points total approximately the same as last year, but are well below other recent years.

The market has been feeling the effect of business depression, yet the

price level is still relatively high, as compared to general commodity prices, and some other farm products as well.

Inquiries are coming into the market in regard to probable feeder prices for the coming season. The prospect is for a supply about in line with last year, but demand will depend on how business conditions develop, and the supply and price of corn and rough feeds this season. The feeling now among producers is that feeder prices must be reasonably low or they won't be interested.

Northwest Milk Co-op.

W. F. Schilling, dairy member of the Federal Farm Board, announces that a new co-operative setup for dairymen of South Dakota, Iowa, Kansas, Nebraska, Missouri and Oklahoma would be organized as a central marketing unit.

Mr. Schilling said the new setup is expected to be organized this month. It will maintain sales agencies in Chicago and New York, especially for distribution of butter. One conference has already been held with dairymen of the states named and another is scheduled for this month.

Chicago, June 7, 1930. Watson

First Penn's Strawberries

THE first Pennsylvania strawberries of the season were offered on the Philadelphia market last week and met with a good demand at \$4.50/6.50 per 32-quart crate. Receipts from other nearby sections were light and prices generally averaged higher. New Jersey berries brought \$5.00/6.50 a crate with exceptional lots as high as \$8. Poor stock sold as low as \$3.50, according to the Pennsylvania and U. S. Market News Service.

Receipts of strawberries from New Jersey, Pennsylvania and from the Eastern Shore sections totaled approximately 3,000 crates on June 7. The market was firm for good stock and the demand was fairly active. Pennsylvania berries were generally of good quality and sold at \$4.50/6.50 per 32-quart crate with a few exceptional lots higher. New Jersey berries sold within the same range, according to the Pennsylvania and U. S. Market News Service.

Asparagus Steady

The asparagus market was about steady but the demand was only moderate. Pennsylvania and New Jersey very large green stock ranged from \$2.50/2.75 with a few fancy lots higher. Large stock brought \$1.75/2.25, medium \$1.25/1.75 and small 75c/1.25.

Receipts of dressed poultry in New York from nearby sections were light but there was a fairly active demand for broilers. Prices of broilers ranged from \$3.50/4.50 a pound while ducks brought \$1.90/2.00.

The potato season is working up the coast and it will be only a comparatively short time before the New Jersey season begins. At present North Carolina is the chief source of supply with daily shipments running as high as 400 cars during the past week. Reports from this state indicate that yields were cut seriously in most counties by prolonged drought but that the quality and size of the potatoes is good. A few less than carload lots of Norfolk section potatoes were received in Philadelphia this week indicating that the season there will soon open. It looks as though there will be less overlapping of seasons in the various producing sections than in some years of the past and this will be a boon to the growers.

Peas Hold Steady

Peas were steady at \$1.25/1.50 per bushel and there were some lots of fancy stock higher. Radishes met a moderate demand at 85c/1.25 per bushel while parsley sold at \$1. The lettuce market continued dull and nearby Big Boston sold at 50c/75c a crate. Eastern Shore cabbage brought \$1.15/1.75 a barrel.

Nearby sour cherries of only fair quality brought 75c a pound while raspberries brought 18c/20c with a few fancy lots of Maryland stock bringing 25c. Apples sold slowly and nearby Rimes ranged from \$2.50/3.50 per bushel.

Philadelphia Produce Review

THE Philadelphia egg market during the past week was generally steady with no outstanding features. The price range was narrow with limited business reported on the general run of stock. Eggs of good quality commanded premiums and buyers were willing to purchase fancy goods at a premium. However, many of the eggs offered were of ordinary quality and sold at low prices.

The trend of the market is indefinite; some dealers expect higher prices, while others anticipate lower prices due to industrial depression. The demand for fancy white eggs was satisfactory with stock fairly well cleared.

According to the statistics issued by the Department of Agriculture, the storage movement of the four principal egg producing states has not been running as briskly as in previous years, due to a falling off in production in many sections. Western advances indicate lighter collections with quality irregular due to the warm weather.

The New York egg market was steady with very little fluctuation in prices. Late in the week nearby hen white eggs were quoted at 24c a dozen, nearby browns at 24c a dozen and mixed colors at 20c/27c. Pacific Coast white eggs ranged from 25c/34c.

Butter Unsettled
The butter markets were unsettled in all sections of the country. Price quotations on the Eastern markets but were about one-half cent higher at the close. The statistical position of the market is a weakening factor. Available figures on receipts and storage movement show considerably heavier supplies than during the same period last year.

When to Cut Hay
To make the best quality hay all clover and grass crops should be cut at or just before the full bloom period. Comparative tests made at our experiment stations show that the digestible protein in timothy shrinks 40 per cent from the blooming stage to the mature stage; in clover 41 per cent and in alfalfa 45 per cent. In addition to a loss of digestible protein, the crop also loses almost as much in palatability.

A Nice Sum

A NICE sum of money is \$157,700,000. That is what the 300,000 farmers in this state took in last year from the sale of milk, eggs, wool and honey, according to state statistics. The sum is almost \$2,000,000 more than was taken for the same products in 1928. Milk was the largest item, being \$113,000,000. Eggs came second, returning \$43,000,000.

RAY AND STRAW

Pittsburgh quotations.—No. 1 timothy, \$2.20; No. 2, \$2.10; No. 3, \$2.00. No. 2 timothy, \$2.10; No. 1 light clover mixed, \$2.10; No. 1 clover, \$1.85. Sound dry clean oat straw, \$1.30; sound dry clean wheat straw, \$1.30.

FEED MARKET

The following quotations are for transit and nearby shipment June 6, according to the U. S. Bureau of Agriculture. Economies. They show the approximate cost of feed per ton (all in 100-lb. sacks) and grain per bushel in carlots arrival at Philadelphia and Scranton rail points: No. 30, \$3.50/3.50; standard middlings, \$3.50; flour middlings, \$3.50; cottonseed meal, \$4.50; No. 1 white corn, \$2.50; No. 2 white corn, \$2.40; No. 1 yellow corn, \$2.30; No. 2 yellow corn, \$2.20.

WOOL MARKET

Boston, June 7.—The activity in the wool market has been maintained at a rate fully up to last week, says the U. S. Department

of Agriculture Market News Service. While some houses did not move quite as much wool as during the previous week, others sold a considerably heavier volume. Prices on domestic wools were steady to very firm. The most active grades were 64s and 66s, 68s, 70s, 72s, 74s, 76s, 78s, 80s, 82s, 84s, 86s, 88s, 90s, 92s, 94s, 96s, 98s, 100s, 102s, 104s, 106s, 108s, 110s, 112s, 114s, 116s, 118s, 120s, 122s, 124s, A NEW idea . . . a revolutionary idea . . . for the quick and economical cooling of milk on the dairy farm. Electrically operated, automatically controlled, it requires but little attention. Immediately after milking, place your cans of milk in the ice cold water within the ESCO Milk Cooling Cabinet and the temperature of the milk quickly drops to below 50 degrees.

The ideal cooling and storage system that you have been wanting. Ask your Power Company, Electric Refrigeration Dealer, or write direct to us

ESCO CABINET COMPANY
World's Largest Manufacturers of
Milk Cooling Cabinets
WEST CHESTER, PENNA.

Craine Standard Silos

Cost LESS than Home-made Affairs

In 1929 Craine introduced the Commercial Standard Silo—made of first quality materials throughout—good for years of good service—but selling at a price that is actually less than it costs the average farmer to get out his own lumber for a Silo. This is but one number on THE CRAINE LINE. Besides there are Triple Wall, Tile and Concrete Stave Silos—11 kinds in all.

"Send Me Your Silo Catalog"

CRAINE, Inc.
70 Grant St., Norwich, N. Y.

SWINE

BUY HALL'S SUPERIOR TYPE POLANDS. High-class, registered, 8 weeks to 10 months. For sale, G. S. HALL, Farmdale, Ohio.

DUBOIS.—Service hogs, sows and gilts bred for Ang. & Seg. farrow, spring pigs. Best blood lines. J. W. Williamson, Murfreesville, W. Va.

TEN REGISTERED BERKSHIRE PIGS and one boar, ready to mount, \$12.00 each. W. F. McFARRAN, Farmdale, Pa.

Feeding Pigs, 15 to 50 lbs., \$4.50 to \$8.00 according to size. Truck delivery on large lots. Monthly payment plan. Stanley Short, Cheswold, Del.

BIG TYPE CHESTER WHITE PIGS, 10 weeks old, by a State Fair First Prize Boar. Catalogue, H. E. BENAN & SON, Thurman, Ohio.

QUALITY CHESTER WHITE, Oct. 1, 1935, gilts, bred for fall litters. Shipped P.O.D. on approval. A. H. Crownever, Mt. Sterling, Ohio.

Chester White Pigs Properly mated. Write your wants. R. L. MUNCE, Canonsburg, Pa.

CATTLE

MILKING SHORTHORN BULL AND HEIFER Calves for sale, 2 to 7 months old, from good breeding dams. Accredited herd. LEE, R. SCOTT & SONS, Burgettstown, Pa.

D. S. POLLED HEREFORDS.—A fine selection. Cows, heifers, bulls. Come or write. CHAS. D. OILL, Millersport, Ohio.

BUCK & DOE RUN VALLEY FARMS Hereford Cattle—Poland China Hogs—Hampshire Pigs—Draft Horses. THE SAINT AMOUR COMPANY, Mortonsville, Penna.

MILKING SHORTHORN Bull calves, 2 to 6 months old. Also a few cows, blood Federal accredited. Burgeon & McKelvey, Kittanning, Pa.

Angus Cattle at reasonable prices. Write BAYARD BROS., Waynesburg, Pa.

HORSES

REGISTERED BELGIAN MARE—2 yrs. old, weight one ton, bred to Laramie H. Also her stallion colt, eleven months old, sired by Laramie H. The six-year-old blue roan show gelding, weight 2,300 lbs., also noted show pig. All good workers. SWEET BRIAR FARMS, J. E. Patterson, Supt., Chestersland, Ohio.

DAIRY CATTLE

DISPERSAL and CONSIGNMENT SALE

JUNE 26th, 1936 at 10 A. M.

at Farm, W. S. Billick, Elizabeth, Pa.

35 PURE-BRED GUERNSEY 35 COWS AND HEIFERS, 4 BULLS.

CAN FURNISH high grade Holstein cows and heifers in various lots. T. B. tested. Olmar & Briggeld, West Concord, Minn.

REGISTERED GUERNSEY BULL FOR SALE. T. B. tested, 3 1/2 years old. HENRY G. BECHTEL, R. 1, Spring City, Pa.

ONE EXTRA FINE REGISTERED GUERNSEY bull calf, born May 8, JOSEPH E. WUFFLEY, Bell Phone 28-J, Avonmore, Pa.

PURE-BRED REGISTERED AYRSHIRE BULL, 12 months old. Inquire or write. FRANK VAUTER, Uniondale, Pa.

AYRSHIRE CATTLE of the best blood lines. Herd T. B. Accredited. Animals of both sex and all ages. Geo. B. McConnell, Wellington, Ohio.

Farm & Dairy

By L. W. LIGHTY

A NUMBER of years' observations at the Missouri Experiment Station proved that clover roots are great soil conservers. In the corn area having no clover roots two and a half times as much soil was lost by washing as on the land having the clover roots.

Those who have given consideration to this loss of soil by erosion while under cultivation have in many cases dropped the old plan of farming by the fields and plant the hoed crops in comparatively narrow belts with belts of sod adjacent. In this way the amount of water collected is comparatively small and the soil that is picked up by the water is largely deposited on the sod strips.

This plan of soil conservation interferes with the rectangular fields and the boasting of straight furrows and rows, because the tilling must of necessity be done to conform in a measure with the slope and contour of the land. But after learning that on sloping land which washes easily we lose much more soil fertility by erosion some seasons than the crops take up we do well to abandon some of our old notions of rectangular areas.

Observations by experts have determined that on a gentle slope with a silt loam under continuous cropping with no sod seven inches of soil would be carried from the surface in twenty-six years. This may give us a comparative idea of the loss of soil and its fertility by surface erosion. Then we must remember it is the fine particles that are carried away which particles furnish the plant food. Pebbles and small stones remain, but from them we get little plant food.

We Work in Circles

THE great philosopher Emerson wrote a delightfully instructive essay on circles. Our work on the farm corresponds with his philosophizing. A practical farmer visited me lately to counsel on some farm building. He said: "I seem to be running around in a ring all the time in my farm work and management. All the crops I grow seem to depend in a great measure on my clover crop. If I have a large clover crop I am quite sure of a good crop of corn and wheat as well as potatoes. Also if my last crop of clover was good it is much easier to get the following clover crop to thrive. Therefore, I try to learn the wants and needs of clover and supply them and I find my circle of good crops is complete."

"I drained the wet spots, manured the soggy and clayey places heavily and applied lime over the entire area. I secured seed that was adapted and otherwise the best procurable and for several years I have inoculated the seed before sowing. I have had no clover failure in four years and in fact my clover has been very good since I have left nothing undone that seemed necessary. I not only grow more clover but I feel sure it is better clover, because I get better results. Going around this circle seems like a spiral, every time around it is a little larger."

This farmer has worked out his soil production problem in a most successful manner. He did not say, but I add that the man who fails to consider and grow clover also travels in a spiral, but the circles gradually become smaller until the vanishing point is reached.

DAIRY NOTES

THE good cow is a lover of the quiet life. Her fear complexes should be considered and not excited. Contentment and comfort must be her constant companions. She should have the still waters and the green pastures.

If she is not a good cow she is not a fit associate for a man with a family, for she is a despoiler of the innocent, a wastrel, an extravagance. W. F. McFarran

Most Effective STOCK SPRAY Ever Developed

Tanglefoot Stock Spray is a powerful double-duty insecticide. It kills, repels and remains effective for hours. Here is quality without equal. No other spray compares with it. There is not a single objectionable feature. No insect can survive its deadly mist. Spray morning and night to keep farm animals free from flies in field and barn all the time. Tanglefoot never taints milk. Continued use will neither burn or blister the hide, nor stain, discolor or gum the hair. Increased milk production pays for Tanglefoot Stock Spray. Try this remarkable product. Prove by actual experience why important dairymen everywhere use it exclusively. Here is a product worth demanding. Satisfaction is guaranteed. The leading merchant in your community has Tanglefoot Stock Spray or can get it for you.

Farm Engineering

Which is the best silo to erect, wood, concrete or concrete stave? Which is best, concrete bottom or dirt floor? Paul Scott.

WOOD silos, when made of two-inch white pine or red wood staves, last for a long time. They are fairly cheap and give good service both in preserving the silage and in preventing freezing. They will loosen up by shrinkage during the summer, so the bands which hold the staves must be kept tight.

The concrete silo is very good. The forms are rather expensive to build unless several people use the forms, either buying them second-hand or renting them.

In making the concrete for silo construction only about seven gallons of water to the sack of cement should be used. If too much water is used, making a sloppy concrete, it will be porous when it sets and will have a tendency to soak up the juice from the silage.

I am inclined to believe that the concrete stave silo is a very good one comparatively cheap to erect and if the slabs are made of good concrete, they give fine satisfaction.

A good many people use dirt floors in their silos if the subsoil into which the foundation is dug is clay. If sand, I think a concrete floor would be advisable.

R. U. B.

The Corn Combine

A NEWCOMER among the efficient modern farm machines was given its first demonstration in Kansas early last month. Traveling down damp rows of corn left standing since last year it picked off the ears, shelled and cleaned the grain, and shredded the fodder which was left on the ground to be plowed under.

A committee appointed to keep tabs on the demonstration reported that four and one-half acres of standing corn was harvested in three hours. The average cost was \$1.18 an acre, slightly less than three cents a bushel. The average speed of the tractor was 2.4 miles per hour. It is believed the machine will make an even better showing in dry corn where the yield is higher.

Stippling Wall Papers

An interested in improving the walls of a room and would like to know what sort of paint could be used to sponge stipple wall paper to brighten it up. Would not ordinary paint make the paper look oily, or cause it to loosen from the walls? Would be glad to receive any information on this subject.

H. E. W.

WHEN wall paper is sponge stippled or scumbled, it should first be brushed off and any loose places fastened down, then given two coats of rather thin glue size, letting each coat dry before the next is put on. It is then given two coats of flat wall paint. The stipple coat is then put on of somewhat different color and stippled or scumbled by means of a flat sponge or a wad of soft paper.

In general it will not pay to put this much labor and material on wall paper which is never safe against cracking or peeling off. It will be far better to remove the wall paper and smooth up the wall, then paint and tiple directly on the plaster and thus have walls which are much more lasting and secure than paper and which can at any time be freshened up by cleaning with soft water and a mild soap.

I. W. Dickerson.

Calclimined Walls

WHERE walls have been calclimined several times and there is a tendency for it to peel, under these conditions the only wise thing is to remove all of the calclimine down to the bare walls. This is usually done by soaking with water, scraping with a broad paper hanger's knife and then washing again and finally smoothing with a piece of sand paper. The wall should then be sized and painted in the usual way.

Farm homes that are castles

You can tell the farm home which is a castle in the proper sense of the word. Not a mansion to be sure. But always imposing, impressive. Large, sunshiny rooms in the midst of broad acres and open fields. Expanse of ground, fresh country air. Neat trimmings and landscaping which add dignity to the house.

You know before you enter that the owner has a certain soundness of thinking usually called business sense. Always on guard against waste. And usually the housewife tells you that thrift—care and scrutiny at the time of buying—bought those extra-which make the inside seem so complete. For, she adds, they read the advertisements.

Reading the advertisements tells you what to buy and how to get most value for every penny spent. A dozen needs arise on your farm every week. Knowing which machine which tools, which automobile, which suite of furniture, which cooking fuel is the best for the price you pay, will save money otherwise thrown away. Perhaps as little as twenty-five cents a week—perhaps a hundred dollars a single purchase.

You can beautify your home—make a real castle out of it—with money saved in buying advertised goods. When you buy merchandise advertised by name, you get purchase value in the greatest degree from every dollar spent.

It pays to read advertising

This Electric Range on a farm in Montgomery County cuts down kitchen work for the busy farm woman.

FARM WOMEN ... say they like the ELECTRIC RANGE

THERE are thousands of electric ranges cooking their three meals per day in the homes of Pennsylvania. Farm women in many parts of the state tell us they like the electric range. No two give the same reasons but the following lists the main features that appeal to them.

Making "Good Luck" Certain

Any one who has been so fortunate as to sit in for a real farm dinner knows that the farm woman has brought the art of cooking to perfection. They say, however, that they have had "good luck." What this really means is that they have guessed the mood and temperature of their stove correctly. With the electric range, where the oven has an automatic control which can be set for any temperature desired, guessing becomes a certainty and "good luck" is sure to follow. The perfection of the meal cooked is the farm woman's desire and the electric range meets this requirement. The oven of the electric range cooks meats with practically no shrinkage since there is actually no combustion taking place as with the usual cooking fuel.

Cleanliness

Electricity does not burn to make heat. It is heat itself... odorless and smokeless. For this reason there is no smoking of the pans and kettles leading to that most dismal after-dinner job of scouring and cleaning. There is no smudging of the walls, woodwork and decorations of the kitchen or other parts of the house. The wood box or fuel bucket can be banished from the corner of the kitchen. The dirty job of taking out the ashes and cleaning up the floor thereafter is ended. The better the housekeeper the more she appreciates the electric range!

Labor Saving and Convenience

The farm women, as a class, work the longest hours of any group of persons. Electricity functioning through the electric range, bringing fire by wire, will save from one-half hour to an hour of labor per day, with no wood or fuel to carry, or fire to keep up, or ashes to clean out; no floors to be mopped as a result; no smoky pans to be scoured; and through greater speed of the cooking units almost instantaneous heat instead of having to wait. Where one is away from home much, the time clock is a great convenience. This device permits the placing of the meal in the oven and setting the clock for the meal to start cooking at the desired time. Thus the entire family can go to church and come home and find their meal ready for them at the desired hour.

Cool Kitchen

Since no air is required for electricity to heat, ovens are tightly insulated, thus giving off very little heat in the kitchen and making full use of the heat in the oven. This leaves the kitchen practically as cool as any other

room in the house. In fact the electric refrigerator may sit in the kitchen near the electric range, if desired.

Safety

Since there is no combustion there are no flaming fuels about the stove, nothing to blow out, no fuel-burning odors, no smoking from poor draft. The electric range is silent and simple to operate. This safety feature is much appreciated in cases where there are small children in the family.

Attractiveness

While the electric range can be secured in black finish, the cost is not a great deal more for white enamel, which most housewives prefer. This requires much less work to keep clean than has been spent in applying stove polish in the past. With the stove itself an attractive unit, without fumes or dirt, the kitchen may readily be kept so as to please the most fastidious housekeeper.

Economy

No other combination of cooking appliance and fuel can offer all the features of the electric range at as low a cost. Rate schedules are so designed that the cost of electricity for cooking will average about 1c per person per meal for current or about \$1.50 per month for a family of five. It will vary above and below this with the size of the family and the amount of cooking that is done. Farm women say that it has cost them about this sum for the purchase of other summer fuel. When all the features of the electric range are taken into account, they consider it economical as well as being the most perfect method of cooking. Ask the women who have the electric range if they would give it up. We believe they are convinced that

Your electric company maintains a staff of engineers and home service workers for the purpose of perfecting and demonstrating the application of electricity to the work of the farm and home in the form of light, heat and power. No charge is made for this service. We shall be glad to have you call at your local office for any information and assistance.

Farm Facts and Fancies

By ALVA AGEE

You have a right to demand the results which come from years of research, investigation and study, and the economies of our tremendous production.

Thousands of farms are proving that Park & Pollard feeds stand the acid test for maximum feeder profits.

Dependable Feed for Every Purpose

Poultry Feeds: Lay or Bust Dry Mash • Red Ribbon Scratch • Growing Feed • Intermediate Chick Feed • P & P Chick Starter • P & P Chick Scratch—Dairy Rations: Overall 24% • Milk-Maid 24% • Best-Milk 20% • Herd-Health 16% • Milkade Calf Meal—Other Feeds: P & P Stock Feed • Bison Stock Feed • Go-Tu-It Pig and Hog Ration • Pigeon Feed • P & P Horse Feed • Potomac Table Corn Meal.

WHEN we began liming land to correct soil acidity thirty years ago there was a fear that the lime would reduce the availability of the superphosphate used. That seemed reasonable enough because we knew that a part of the lime had been taken out of the combination in the phosphatic rock to get the phosphorus into available form. Another fact was that untreated rock gave its best results in an acid soil, losing a part of its lime and gaining availability.

On the other hand, in that day of much guessing, we knew that superphosphate gave good results in limestone land, and we knew that the use of superphosphate and lime was increasing yields. Nowadays we turn to that hand-book of safe knowledge, the Ohio Station's forty-eighth annual report, and in discussion of tests for acid-soluble phosphorus in plots limed and unlimed for thirty years there is this statement:

"The favorable effect of lime in maintaining phosphorus in a more active or available state is indicated by the increased solubility of phosphorus in the limed soil of both fertilized and unfertilized plots, although the total phosphorus content was less than that of the unlimed soil. This increase in relative solubility substantiates the general conception that soils well supplied with calcium carbonate retain phosphorus as calcium phosphate rather than in combinations considered to be less available."

Lime and Inoculation

The bacteria that produce nodules on the roots of a legume continue in the soil for a long term of years if there is plenty of lime. When the soil is acid, the organisms cannot carry on. The Illinois Experiment Station made a test in the case of soy beans. It found no soy-bean organisms in some distinctly acid soils that had grown soy beans only three years previously, while in plots that had been limed the nodule organisms had remained for fifteen years although no soy beans had been grown within that time. Soy beans withstand more soil acidity than some other legumes, but they cannot return full value unless the organisms are present.

The effect of lime mentioned above and the effect on legume bacteria are only two of the many benefits we gain from liming acid soils. Lime is the friendliest material ever applied to land, and soil acidity in a marked degree is disheartening for land and its owner. The need of liming will continue forever, and I reckon that is one reason nature provided man with so much limestone. It costs good money to apply lime, and it costs many a farmer more not to do so.

The Eastern Farmer's Protection

Two years ago the Interstate Commerce Commission held that it had authority to cut freight rates below cost of transportation when the producers of a commodity were in distress. It did this in the case of some classes of western fruit, and the Supreme Court has decided that the Commission had no right to make such a demand on the railroads.

Our readers may not be specially interested in a contention between these fruit growers and the railroads, but it was urged at that time that their one great advantage was their relative nearness to market. The farms of Ohio and the states east of it would have far less value than they have today if the West could reach eastern markets as cheaply as the eastern farmer can do so. A degree of protection is given by the extra cost of transporting western products to consumers.

The proposal was to relieve the distress of western producers by com-

PELLING the railroads to haul the stuff into eastern markets for less than the transportation would cost. That in turn would lead to increased production in these regions remote from market.

Our eastern farms, generally speaking, are not naturally rich, and they have had continuous competition from the West. There is nothing unfair about that just as long as cost of transportation of products is paid, but cutting below that is an unfair blow at farm values in the older section of our country.

If the rule respecting this fruit had stood, it could have been applied to all manner of western food products when there was serious overproduction. This Supreme Court decision in the interest of justice protects the East's natural advantage.

Where Honesty Leaves Off

I know a man who sold property to a man in whom I am interested. The buyer was new to the region, and told the seller what he was needing, and why. He had excellent reason to believe that the seller was a dependable man, and let his statements have a good deal of weight with him when making up his mind about the purchase. As a matter of fact that seller must have known that the property was not what the buyer was seeking, but he was interested only in making a sale and getting his money out of the property. He proved to be dependable only in respect to looking after himself.

Some will say he was only within his rights in looking out for himself, just so long as he told no untruths. This matter of determining where honesty leaves off and undue self-interest begins is the biggest puzzle of all in buying and selling.

Staying Put

A reader thinks I am drifting away from a liking for good farming when trying now and then to see what could be said for the thriftness and what should be said in praise of owners of "homely farms." Not at all, though the two classes are miles apart. In the first case nobody had a good word to speak, and it was worth trying. The second class is full of sensible folks that it could offer its own defense if it were the least interested in doing so.

Personally, I like a type of farming that lets a man put as much energy and hustle into it as any other successful business man must do. It is a matter of inclination. Despite that inclination, I rather envy the man who tempers hustling with a true philosophy that he takes time to think over. No, it was chiefly an excursion into fairness and an admission of his man rights.

Striped Cucumber Beetles

THE striped cucumber beetle feeds on cucumbers, melons, squashes and pumpkins. Pumpkins are a kind of "iron ration" for him, however. H. C. Hockett says: "Controlling cucumber beetles is largely a matter of chasing them out of one field into another."

Home gardeners may chase them by dusting their plants with a mixture of one part of calcium arsenate and fifteen parts of hydrated lime. This may be shaken over the leaves through cheesecloth or other coarse cloth—New York College of Agr.

WITH fewer blacksmiths and with more machinery to break, the farm shop becomes more important each year. Bulletin E 108, "The Farm Shop and Tool Equipment," suggests the tools you need. Write the Mail Room, Roberts Hall at Cornell University, Ithaca, N. Y., for your copy. It is free.

Emergency Crops for Winter

ONE of the most severe drouths ever experienced in the East was broken up last week by a gentle rain more than 15 hours. It is now a foregone conclusion that the meadows will not make a half crop, but there is yet time to make a good corn crop. Farmers are writing me from many sections asking what they can sow or plant to make feed for their livestock next winter. He is worse than a quitter who will decide to sell his stock because he will not have hay to winter it.

I will proceed to discuss some crops that can be grown to take the place of hay. I have seen corn planted after the hay has been harvested and a wonderful lot of very good feed produced. It may be drilled in rows or broadcast with the grain drill. There are few crops that can be grown that will excel corn in tonnage. Cattle will eat this feed with relish and do.

Sorghum can be handled in the same way and to as great an advantage. It makes a very palatable feed and cattle will eat it with as great relish as they will silage. If desired other of these crops could be put in the silo.

Soy beans can be sown as late as the first of July and make a very good feed. A subscriber asks how it would be to sow millet and Sudan grass together for hay. I have sown both Sudan and millet with soy beans and they did very well. Have never mixed millet and Sudan grass but I imagine if our correspondent tries it he will find his stock next winter picking at the Sudan and leaving the millet for the last. Both millet and Sudan have about the same feeding value as timothy hay but the Sudan being a member of the sorghum tribe is sweet and is relished by all kinds of livestock. Care should be had not to let the Sudan grow late in the fall after a frost. It is said to poison stock eaten after it is frozen.

I know nothing that is not a legume that will equal Sudan as a supplemental crop. I have sown millet after had cut my meadows and plowed them and raised a fine lot of hay. If allowed to mature the seed it is not very safe to feed, especially to horses, but at that stage it makes a very

heavy draft on the soil. One reader asks whether he could sow sweet clover yet and cut it for hay. It might be done but I would rather risk some of the crops named above. Hubam clover no doubt would do the work. It is an annual and grows more rapidly than the biennials. W. D. Zinn.

Every Man's Farm a Jungle

IF it were possible to magnify a pasture several hundred or thousand fold—and all the parasites in the same proportion—so that blades of grass would appear as tall bamboos and small forage plants as great jungle trees, it would be easier to convince livestock growers of the desirability of careful attention to sanitation and of the importance of constant watchfulness in combating the ravages of parasites that live in the pasture and attack the various kinds of livestock. So speculates the U. S. Department of Agriculture.

Many of these parasites have powers of reproduction and multiplication that seem marvelous. Thousands of immature forms will come from a single adult parasite. Many live through complicated life cycles and may have one or more intermediate hosts on which they live between their attacks on horses, cattle, sheep, or swine.

The stomach worm, that infests the sheep, for example, emerges from the ground and finds a resting place in a tiny curl in a blade of grass. There it remains while the grass develops. If no sheep bites off the grass the stomach worm in time dies. If a sheep crops the grass, the stomach worm enters and becomes active within the sheep's stomach, joins with other stomach worms, and preys on the sheep, which is likely to become unthrifty and unprofitable.

Fortunately for the livestock growers, most of these parasites are able to live and reproduce only when they are able to attack domestic animals of the same or closely related species. The danger from parasite-infested pastures is by no means so great if it is possible to use this year's horse pasture for cattle or sheep next year and for hogs the third.

Reservation Blank for Pacific Northwest Tour

(SEE PAGE 8 FOR ANSWERS TO TOUR QUESTIONS.)

Tour Manager, Pennsylvania Farmer, 7301 Penn Avenue, Pittsburgh, Penna.

Sir: Enclosed find check (or money order) for \$20 per person for reservations on the Pennsylvania Farmer Pacific Northwest Tour. I shall join the tour at the town marked below. Before July 15th I shall mail check for the amount shown opposite the town where I shall join the party. I understand that no further payments will be required and that all money paid will be refunded if I cannot go.

| | |
|--|----------|
| PHILADELPHIA, Paoli, Frazer, Conesville | \$269.92 |
| LANCASTER, Elizabethtown | 297.00 |
| HARRISBURG | 294.92 |

Uses Pyrox Instead of Home-Made Bordeaux — Gets Increased Yield

IN every potato-growing section, the farmers who are using Pyrox instead of home-made bordeaux are getting bigger yields, finer quality potatoes, and more profits. The extra yields obtained with Pyrox more than pay for the cost of spraying and leave extra cash besides. Mr. A. J. Meyer of Annville, Pa., writes:

Mr. A. J. Meyer of Annville, Pa.

"Last spring I decided to make a comparison of Pyrox and home-made bordeaux sprays so I put on one-acre tests for each material."

"At digging time in September accurate measurements of the land and weights of the potatoes were made. The potatoes sprayed with Pyrox yielded 287 bushels per acre, and where the home-made bordeaux was used 241 bushels per acre. This was a gain of 46 bushels to the acre for Pyrox, a substantial increase. This gain pays the spray material bill and leaves a profit."

"All conditions for the two plots were the same in every respect and I believe that the Pyrox spray is responsible for the increased yield."—A. J. MEYER.

If you have not used Pyrox try it this year. Pyrox is a combined insecticide and fungicide that kills insects, prevents blight, and other plant diseases, and stimulates plant growth.

Quick and easy to use. It does not clog the nozzles and sprays in a fine mist. It has excellent sticking and covering properties.

Spraying with Pyrox not only results in the extra yields normally expected from spraying—the user can anticipate a still higher yield which will pay for the difference in the cost of the Pyrox many times over.

Pyrox is obtainable in all sizes from 1 pound jars to 300 lb. barrels, and is offered at the lowest price since 1899. See your dealer today and obtain from him a copy of the new illustrated Pyrox Spray Guide.

When writing advertisers please mention Pennsylvania Farmer

FIFTEEN years ago, economists discussed the factors that make livestock prices. Nowadays, livestock producers speak understandingly of price factors, and it is no longer popular to say the packers make livestock prices.

Producers know their economics. The discussion that has been and is taking place regarding the recent situation in the lamb market proves this.

Most producers know there were 2 per cent more lambs on the principal markets in January, 21 per cent more in February, and 39 per cent in March, 1930, than in the same months last year. And these lambs

were 3 per cent heavier. This describes the supply situation.

Because of greater supplies and lessened consumer buying power, government figures show that live lamb prices in March dropped \$5.95 a hundred weight under 1929. A drop of \$3.79 a hundred weight (live basis) in dressed lamb and \$2.01 a hundred weight (live basis) in wool, accounts for most of this. Other by-product prices also are lower.

The above figures clearly substantiate the statements made by "economist-producers" that lambs can be worth no more than the value of wool and dressed lamb.

THE ANSWERS

ON page 8 of this issue are the answers to questions asked about our tour to the Pacific Coast. If your questions are not all answered there drop us a line and get a prompt answer by mail.

ON OLD PASTURES

A CORRESPONDENT of the London Livestock Journal says: "Lime is badly needed on three-fourths of the farms of this country." We found that the best of the wonderful pastures of England had liberal applications of lime in some form whenever the eye of the master saw that it was needed.

MEN WANTED

TWO weeks ago we stated that there is no shortage of farm labor and said that we had received more applications for jobs than for men. The reverse is now true. More requests for men have been received than we could supply if all our applicants were unemployed. We do not conduct a labor agency and cannot do so, but we like to help both sides whenever that is possible.

EMERGENCY CROPS

HAY will be a short crop over a wide area this year. On another page of this issue Mr. Zinn discusses emergency hay crops, and the emergency exists here and now. In addition to his suggestions we mention the possibility of cutting oats a little greener than usual and utilizing the straw. British stockmen depend on oats straw for roughage much more than we do, but that straw is never dead-ripe when so used.

FROM LIFE

A YOUNG man who wanted a position with a well established company was asked to call on the president. He did so and they discussed the business at some length. The president mentioned various shady ways of getting business but did not condemn them. The young man condemned them in his own mind but did not speak out against them. He never got the job. He was being tested, though not fairly, and in the eyes of his prospective boss he had failed to stand the test.

PENNSYLVANIA FARMER

A REASON FOR MULES

IN the Journal of the American Veterinary Medical Association Major George H. Koon of the Veterinary Corps, U. S. Army, gives some interesting facts about horses and mules in the army. During the period of the greatest activity in France, July 1, 1917, to November 11, 1918, losses of horses in service were 25.37 per cent. In the same period losses of mules were only 10.88 per cent. From the beginning of the war to the treaty of peace, over two years, losses of horses were 14.9 per cent, and of mules 4.6 per cent. These figures suggest one reason why so many thrifty farmers use mules.

A NEW TARIFF

AFTER a wrangle of about eighteen months the new tariff bill got through the Senate by a vote of 44 to 42, the House passing it by a substantial majority. The President has announced that he will sign it, and so relieve the country of the uncertainty which is always had for business. Heretofore we have expressed our opinion as to the effect on agriculture of this legislation and nothing further in that respect is necessary, for soon it may be judged by experience, which is of more value than any number of opinions. The new law is certain to become the subject of partisan debate in which many distortions are common. Let us try to judge it calmly and from a business standpoint rather than from a political standpoint.

SIGNIFICANT CHANGES

THE International Livestock Exposition announces a number of changes in its plans for future shows. Two of these changes are of special interest as indicating tendencies in the livestock business. The extremely heavy market hog is barred from future shows. Hereafter no barrow weighing more than 350 pounds will be allowed to compete for prizes. Probably another 50 pounds will be taken off some day as the heavy hog is an extravagance no longer desired by producers or consumers. The other change in the Exposition plans is the elimination of the old bull from the show-ring. In the 1926 show no bulls born before September 1st, 1926, will be allowed to compete, Angus excepted. That breed's aged bulls may date from May 1st, 1926, this time but not hereafter. This idea is correct. The aged bull's place is in the breeding herd and not in the show-ring.

A QUEER DEAL

THE bulk of the fine wool of Southwest-tern Pennsylvania has been sold. Most clips brought 25c straight but as high as 27½c was bid for some wool known to be practically all fine delaine. The National Wool Marketing Corporation has been trying to get some Pennsylvania wools. Its agent offers to lend the grower whatever the cash buyer pays, then to pay him in addition whatever the wool brings in excess of the advance. The grower is to pay six per cent interest on the amount advanced. These growers are not members of any cooperative wool marketing organization. Why pay dues when the Corporation advances the current price with a promise of more if the wool brings more? The Corporation's action, taken at considerable expense, is speculation rather than cooperation. Or is it in part an attempt to lend more three per cent money at six per cent?

CATTLE ENOUGH

AFTER hearing about a prospective cattle shortage for nearly half a century we have concluded that there isn't going to be any such thing. There might have been a shortage of beef long ago if production had continued in the old way and consumption

on the old scale. But things have changed, and all the changes are improvements so far as the beef supply is concerned. Winter and disease losses, so common in the old-time range industry, have been brought down to a low point. Better feeding has not only helped to reduce losses but has produced bigger calf crops. Better breeding has resulted in earlier maturity, so that three cattle now go to market where two or even only one went in the old days. The same principles applied to the production of hogs and sheep have resulted in a bigger output of meats, and with an abundance of some meats there is not likely to be a famine in any. This country has had enough cattle in all its past history except in time of war, it has enough now, and it is likely to have enough in the future to prevent any beef famine.

NOT EARNING

PROBABLY farmers constitute the only large class of men now fully employed. They all have a job of some kind; but the latest estimates (April) show the number of idle union men in other industries to be 20 per cent, in the building trades 40 per cent. Another statement may be of interest to those who lack farm dividends, at least such as are payable in cash. Since the first of this year 257 corporations of such magnitude that their earnings are of public interest have either reduced their dividends or omitted them entirely. These things are not stated for the purpose of comparing agriculture, either as to labor or as to capital, with other industries, for they afford no basis for proper comparison. They are given merely to suggest one of the reasons for the current lower prices of farm products.

TO INFORM CONSUMERS

THE New York Mercantile Exchange has done good work in bringing to the attention of consumers the fact that wholesale prices of eggs are low and telling them what retail prices should be. This example should be followed in every case in which retailers fail to adjust their prices to the wholesale market. Consumption depends on retail prices to a very large extent, and unless such prices reflect actual conditions neither producers nor consumers get a square deal. The Mercantile Exchange would have done better, however, if it had omitted reference to meat from its statement to consumers. It has no right to assume and to say that eggs are "healthier foods than any meat product" as well as cheaper. Such comparisons are unnecessary as well as unfair.

THE NEW MILK CODE

SEVERAL kinds of letters come to me about Pennsylvania's new milk code which goes into effect September 1st. Some inquirers merely want to know what it is. Others evidently have been misinformed about its provisions and need to study it. Still others have made up their minds that the code is for the advantage of big dairymen and distributors; or is designed to put the little man out of business. We have published several articles in reply to these questions and will soon present another, prepared by the Department of Health at our request. Let us say now that the new code is not designed to put anybody out of business who deserves to remain in business. It is not intended to discriminate in favor of big and against little producers. It is not likely to wreck the dairy business or to bankrupt the dairyman. In the end it will help the business, for all measures which improve the quality of the product have this effect. Let us give a fair trial to a measure which was framed mainly by dairymen, and was backed by them, instead of condemning it in advance.

June 21, 1930

June 21, 1930

AST Wednesday the New Jersey College of Agriculture and Experiment Station was host to 4,000 farmers attending the annual Field Day. The day was bright and clear, and the prospects of gloomy prospects in the week. By noon parking spaces were filled with cars and the college campus with its tents and crowds of people lent a festive atmosphere to the occasion.

Field day is one time in the year when New Jersey farmers put aside their farm work and with their families spend a day at the Experiment Station. Here they gain further information concerning the experimental work conducted in their fields, become acquainted with the people who are in charge of this research work and renew old friendships. Each year a greater number of farmers take advantage of the opportunities offered by field day.

The station staff spent a busy morning answering questions and helping to solve various problems brought to them by poultrymen, dairymen, fruit growers and others. The afternoon was spent in inspecting the poultry flocks, the dairy, the orchards and the many experimental projects being conducted on the college farm. Signs about the experimental plots and farm explained clearly and briefly the nature of the tests being made and in some instances the visitors could judge for themselves the results of the various practices. The exhibit of historic farm implements formerly used in New Jersey attracted considerable interest and comment among the visitors. The college now owns several of the earliest types of cultivators and plows used in the state and is gradually building this agricultural museum.

THE need of agriculture to organize production on a large scale through co-ordinating the production of the many small farm units and centralizing the control of marketing and distribution is pressing, said Dr. A. Lipman, dean and director of the New Jersey College of Agriculture and Experiment Station. In his Field address he elaborated on the problem of organization and said that production of many small farm units could be coordinated either through associations of farmers or through the activities of large-scale buyers who might serve as a nucleus for rationalizing production programs in entire regions.

Referring to the need for centralizing selling and distribution, he advocated the formation of local selling groups which in turn would affiliate with state, regional and national cooperatives as urged by the Federal Farm Board.

Dr. Carl E. Ladd, director of agricultural extension for Cornell University, outlined a long-time program for the development of New Jersey agriculture. He emphasized the need for turning marginal and sub-marginal lands into national and state forests and parks.

Today we are facing a new era in the cooperative field," Dr. Ladd asserted. "Experience, plus facts and scientific studies of farm cooperatives, their many ramifications combine to furnish a basic requirement for a great new cooperative marketing and cooperative buying movement. Thus the time has come to renew our faith in cooperative marketing, to plan through and develop such cooperative movement as shall best serve the business needs of agriculture."

AAC LOWE is not the only Hunterdon county farmer to spend years of weary and back-breaking labor with the hoe in an effort to rid his farm patches of thistles and horse nettle. Only Mr. Lowe threw away the hoe last year and tried chemical means of extermination by the use of sodium chlorate. County Agent Gaunt after visiting Mr. Lowe's farm a short time ago said that although there are a few thistles remaining in one or two patches, most of them had been killed. He believes that two or three more applications of this material will completely eradicate this weed.

Mr. Lowe feels that the chemical treatment is much more satisfactory and less laborious than digging thistles out by the roots. All vegetation was killed for at least three months after the plots were treated by the chemical, but grass is now growing on the treated patches of land.

At least 2,000 people are expected to attend the annual state-wide picnic of the New Jersey Federated County Boards of Agriculture and the

PENNSYLVANIA FARMER

(833) 7

New Jersey Farm Comment

By G. W. HARRIS

State Grange which will be held at Atlantic Highlands, Monmouth county, on July 17. The meeting place for this year is more centrally located than formerly and for that reason an even greater attendance than that of the past is anticipated. President Thompson of the National Farm Bureau Federation and L. J. Taber, Master of the National Grange, are listed as the speakers for the day. In the afternoon two tours of the nearby farm districts are outlined for all those who wish to make these trips.

AGRICULTURAL WEEK at Trenton will be held during the fourth week of January this coming year instead of the second week as in the past. This decision was reached by the State Board of Agriculture in order to avoid conflict with the Madison Square Garden Poultry Show in New York City and the Pennsylvania Farm Products Show which is held during that month at Harrisburg. The new arrangement will give an additional day for meetings, since it will not coincide with the opening of the Legislature and will thus permit the

Some of the 4,000 Field Day visitors at the New Jersey State College.

holding of the official Convention on Tuesday instead of Wednesday.

A TWO-DAY automobile tour, on July 1 and 2, will be conducted through Delaware and Maryland by the New Jersey Horticultural Society for the benefit of New Jersey fruit and vegetable growers.

Several visits will be made near Dover, Delaware, the center of Delaware's fruit growing district. The tourists will spend the night of July 1 at Ocean City, Maryland, and the following morning will continue the tour through the orchard and truck areas of Berlin and Salisbury, Maryland, and Bridgeville, Delaware.

Professor A. J. Farley, secretary of the Society, points out that this trip through a competing fruit and vegetable section will not only give New Jersey growers an opportunity to estimate when some of these most important crops will be ready for market, but will also enable them to pick up many pointers in production from the Eastern Shore growers.

This is the first tour of its kind to be conducted by the State Horticultural Society. C. B. Lewis of Riverton is chairman of the committee making arrangements for the trip, while the other members of the committee are R. P. Hulsart, Manassquan; H. F. DeCou, Merchantville; Wood Wyne, Thorofare; D. M. Babbitt, Bridgeton; and A. J. Farley, New Brunswick.

INDEPENDENT truckers on the Eastern Shore, who within the past few years have built up a tremendous volume of business, especially in the hauling of perishable farm products to city markets, were victorious in their fight against the granting of franchises to two large trucking concerns in which the Pennsylvania Railroad is said to have been actively interested.

Some time ago the Baltimore Transfer Company

and the Peninsula Auto Express applied to the Public Service Commission of Maryland for franchises to establish a network of truck routes on the Eastern Shore. These applications were rejected after vigorous protests from independent truckers en masse, the Del-Mar-Va Eastern Shore Association, Salisbury Chamber of Commerce and many other organizations.

Shore interests in opposing the granting of the franchises felt that the establishment of this network of truck routes would be detrimental to the truckmen who are now operating in those sections. It was pointed out at the hearing before the Public Service Commission that for years the railroads had made no effort to serve Eastern Shore producers and that independent truckers had stepped in and successfully met the needs.

These independent truckers backed by their interests proved themselves a strong and powerful group. If they will only continue to keep a relationship of unity they can do a great deal toward the establishing of uniform hauling charges and place the trucking business on a more stable basis.

Strawberry Industry Expanding

THE growth of the strawberry industry is a striking example of the great expansion of the so-called luxury crops in recent years, says the Bureau of Agricultural Economics, U. S. Department of Agriculture. Time was when the strawberry season was limited practically to the season of locally grown berries. Fast transportation and refrigeration changed this until now consumers may enjoy strawberries practically the year round. Within ten years the commercial acreage of strawberries has increased from 93,420 acres in 1920 to 202,180 acres in 1929, and a projected area of 183,680 acres this year.

"The commercial strawberry," says J. W. Stowbridge in a technical bulletin on the origin and distribution of the commercial strawberry crop, just issued by the U. S. Department of Agriculture, "is believed to be a descendant of the wild meadow strawberry native to the country. The crossing of this wild strawberry of the eastern part of the United States with the cultivated varieties from Chili resulted in hybrids from which the strawberry grown at the present time developed."

"Market production began about 1800, but, because of the perishable nature of the varieties then grown, only small quantities were produced and those in localities near points of consumption. The expansion of the industry as a commercial proposition began about 1860 and has been encouraged by improvements in methods of culture and by the development of varieties which are adapted to meet the variety of growing conditions in many producing sections and which have qualities that give a reasonable assurance of delivery in good condition to distant markets. Refrigeration and other improvements in transportation have aided the development of the industry in sections far removed from the centers of consumption."

The industry has experienced marked changes. Tennessee was the leading strawberry producing state in 1920, but Louisiana, an earlier producing area, now leads in acreage and production. The preliminary estimate of acreage in Louisiana this year is 24,600 acres as against 6,500 acres in 1920. Tennessee in 1920 had 11,090 acres in strawberries, and reached a peak of 26,220 acres in 1924. The estimate for this year is 13,450 acres.

Missouri is second in acreage this year, with 16,710 acres planted, followed by Arkansas with 14,870 acres, and Maryland, 11,750 acres. New York, Chicago, Boston, Philadelphia and Detroit are the leading carload markets, but the consumption in these markets is considerably greater than is indicated by carload receipts, as augmented by increasing motor truck transportation. Indicative of the greater use of motor transportation, Delaware last year trucked strawberries as far as Montreal, Canada.

Mr. Stowbridge has written a comprehensive publication on the various phases of the strawberry industry including discussion of areas of production, yields, acreage trends, production and shipments, varieties, the industry by states, costs of transportation, and market receipts. It has been issued by the U. S. Department of Agriculture as Technical Bulletin 180-T under the title "Origin and Distribution of the Commercial Strawberry Crop."

To be continued.

Garden Supplies Vitamin C

NUTRITION specialists urge constantly that the diet for all ages, but especially for children, should include an abundance of foods rich in vitamins. There are now recognized, however, at least six independent vitamins. As each has its own function to perform in growth and bodily well-being, it is necessary to know what each one does and what foods supply it. Otherwise a dish might supply some, but not all of the different vitamins.

For instance attention is often called to the necessity for vitamin C in the diet. Especially good sources of this vitamin are the citrus fruits, (oranges, grapefruit and lemons), raw cabbage and turnips and tomatoes, raw, cooked or canned. Other foods mentioned by the Bureau of Home Economics of the U. S. Department of Agriculture as supplying this vitamin are apples, potatoes, raspberries, spinach, sprouted legumes and string beans.

One reason for insistence on supplying plenty of these foods is that the body has only a limited capacity to store vitamin C. Replenishment must go on continually. Another reason is that this vitamin is very easily destroyed by heat and oxidation. If vegetables are cooked too long they may lose their vitamin C. All recent instructions on vegetable cookery stress quick-cooked methods. Canning often destroys vitamin C. In the case of acid foods like tomatoes destruction is not so extensive. Tomatoes seem to retain most of their vitamin content either cooked or canned.

On diets deficient but not entirely without vitamin C, children become irritable and lacking in stamina, do not grow normally, and are less resistant to infectious diseases. Shortage of vitamin C is thought to be an important factor in the prevalence of tooth decay and of much of the so-called rheumatism in children and adults. When vitamin C is entirely lacking, scurvy develops. This used to happen on long sea voyages before present knowledge of the preventive value of lemons and other portable foods containing vitamin C.

In testing foods for vitamin C in the laboratory, guinea pigs are fed a basal diet complete except for this vitamin, and then given measured amounts of the food in question. If the animal thrives and grows well, the food is probably a good source of vitamin C; if the animal develops symptoms of scurvy—sore, stiff joints, a tendency to hemorrhage, sore gums, loosening of the teeth, and fragile bones, the food under test probably is deficient in vitamin C. Similar symptoms are found in human beings whose diet has lacked the foods that supply this important vitamin.

Try These Recipes

VEGETABLES grown in the home garden are a welcome addition to the family diet. Among the green vegetables which Miss Ethel Jefferds, home economics extension specialist of Pennsylvania State College, recommends for use are chard, spinach, kale, Brussels sprouts, beet tops, cabbage, romaine, lettuce, broccoli, chicory and dandelion greens.

Such greens increase iron and other minerals in the diet. When eaten raw they are high in vitamins, so important in promoting general health and protecting the teeth. By serving and preparing in various ways, these vegetables can be made appealing to members of the family.

Too much time often is spent in cleaning vegetables, Miss Jefferds says. To remove sand and grit from greens pour warm, not hot, water over them and allow to stand in plenty of water for a few minutes until the sand settles to the bottom of the pan, she directs, and then rinse in one or two clear waters.

Here are a few recipes:
Broccoli.—Wash the broccoli and cook in a small amount of water until tender. If the stalks are long, cut in half. Serve heads on plate with Hollandaise sauce.

Mock Hollandaise Sauce.—Two tablespoons butter, two tablespoons flour, three-fourths cup milk,

grated cheese, and add remaining spinach and cheese. Add beaten eggs to milk and pour over the mixture in the baking dish. Cover top with buttered crumbs and bake in moderate oven for 20 minutes.

A New Salad

MORE than one time in the history of the world the seven-seas search for treasure has ended in finding a pearl on the beach below the homelands. And to the housewife, a new salad, especially an easy salad, is a pearl in the setting of her daily glories of achievement.

A turnip. Yes. You know what a whale of a job it is to set out to peel turnips for the evening stew, and have six to sixteen young ones standing gauntly around you begging for slices of them in the raw. Instinct is a safe guide-post. And, you make raw carrots into salads that enchant these new-fangled vitamin hounds. Then try grated raw turnips. They have a delicacy, a fruitiness, and a faint spiciness altogether ethereal as compared to turnips boiled. They stay white for hours, like cocoon, and combine for health and beauty with all the usual salad dressings.

Carrot, horseradish, turnip and apples are twice as dainty and twice as flavorful, if grated instead of chopped.

M. M. Fetzer.

HOW good those beans will taste next winter! It's not a day too soon to get the canning supplies in shape for those June products. Can your beans while they snap. Gather them fresh the morning you want to can them and work fast. Stem, blanch in boiling water ten minutes, then hustle them into hot clean cans or jars.

Quarts need but one hour if you use a pressure cooker. In a water bath two hours is necessary. If tin cans and a sealer like in the picture are used, the products are hastily cooled in a tub of water, a strong point in favor of tin cans. Write us freely if you have canning troubles. We'll try to help.

G. S. S.

one-half teaspoon salt, one-eighth teaspoon pepper, few grains cayenne, yolk two eggs, one-half cup butter one tablespoon lemon juice.

Melt butter, add flour and stir until well-blended; then add milk, salt, pepper and cayenne, and bring to the boiling point. Stir in the egg yolks, butter bit by bit and add lemon juice.

Baked Cream Spinach.—One peck spinach, four tablespoons butter, salt and pepper, two eggs, slightly beaten, one-half cup milk, one-half cup grated cheese, one-half cup butter crumbs.

Cook the spinach without water, drain and add butter and seasonings. Place part of it in a buttered baking dish, sprinkle it with one-half of the

Foods that Supply Vitamin C

A New Kind of House Warming

By HILDA RICHMOND

AFTER some years of necessary absence from our farm we had the chance to go back. When the tenants finally moved we saw dirt, disorder, fences broken down, gates missing, wall paper torn and discolored, walks torn up—some one in the family said all he could think of was the "abomination of desolation" spoken of in the Bible.

Well, as soon as we had places to sleep and eat and do simple housekeeping, we were surprised by the neighbors turning out in every direction to lend a hand. That kind of housewarming may be common enough in some parts of the country, but it was all new to us. The ladies made preparations for the big meal we had seen in years. The men with teams carted away trash, brought up some wood which they ranked in the kitchen door, the wood house having been literally demolished, split kindlings, trimmed shrubbery and fruit trees in the yard, repaired the broken chicken coop, raked off the garden and had a glorious bonfire which included everything from two year-old corn stalks to the shoes and old clothes discarded by the tenants.

As we live near the school house and pupils joined in the dinner and the welcome. The country minister seeing the large gathering stopped in and added his good word to the pleasure our friends expressed to see us back. It wasn't anything but a city reception, or a fashionable luncheon, but big, hearty welcome from old friends and others who have moved in since. It seems like home now, though there is much to be done, and some day we may have an opportunity to welcome somebody in the same fashion.

To Attract the Tourist

SPARE bedrooms in country houses may well be made to contribute their bit to the family budget, according to the New York state college of home economics. Letting rooms to tourists may prove a pleasant as well as a profitable summer occupation for the housewife with more room than she needs.

Advertising may be done by placing signs along the nearby highway. These should be at an angle to the road, and set low, so as to be within the range of the motorist's eyes as he drives. Letters should be large and definite, either blue on a light ground or white on a black ground, the latter being somewhat more desirable at night. Wording should be simple and concise.

The house should be attractive to the prospective guest. Fresh paint and spotless windows add greatly to the attraction of a house, and the lawns should be well kept, with bright flowers and trees if possible to make the place look homelike and comfortable. All that is necessary to keep interior in tune with this first impression is scrupulous neatness and cleanliness.

The rooms should appear to be cool, and to the end walls and rugs should be light in color and preferably plain. Painted or calcimine walls and hardwood floors are most suitable. Few pieces of furniture are preferable to too many.

Bedrooms should be the coolest places in the house. They should have windows should be, if possible, and in all cases screens should be which make it possible to open the windows without the afternoon sun. Where the furniture available is old-fashioned, the scheme may well be carried out by the use of rag rugs and old-fashioned bedspreads, provided everything is clean.

Service should always be given cheerfully and as efficiently as possible. There should be water at all hours, and meals served at any time. Always a great attraction to tourists are visual tables in the dining room are advisable. It is well for the family not to eat with the guests. When the guests show an inclination to visit, even, they should meet with friendliness and hospitality.

The Jacket Ensemble and Others

No. 6437-6439.—Jacket ensemble for ladies. Jacket 6437 cut in seven sizes: 31, 36, 38, 40, 42, 44, 46, 48, 50 and 52 inches bust measure. Dress 6439 cut in five sizes: 34, 36, 38, 40 and 42 inches bust measure. To make the ensemble of a 38-inch size as pictured, will require 1 1/2 yards of plain material and 1/4 yard of figured material 38 inches wide. Two separate patterns 15c for each of two pieces.

No. 6559.—Cut in eight sizes: 38, 40, 42, 44, 46, 48, 50 and 52 inches bust measure. A 38-inch size requires 5 yards of 38-inch material. For vestee and belt of contrasting material. For vestee and belt of contrasting material. For vestee and belt of contrasting material. For vestee and belt of contrasting material.

No. 6121.—Girls' dress. Cut in four sizes: 6, 8, 10 and 12 years. An 8-year size with long sleeves requires 2 1/2 yards of 36-inch material. Price 15c or two for 25c.

No. 6437.—Misses' dress. Cut in three sizes: 16, 18 and 20 years. An 18-year size with long sleeves, requires 5 yards 35 inches wide or wider. Price 15c or two for 25c.

No. 6440.—Misses' dress. Cut in three sizes: 16, 18 and 20 years. An 18-year size with long sleeves, requires 5 yards 35 inches wide or wider. Price 15c or two for 25c.

No. 6526.—Misses' dress. Cut in three sizes: 16, 18 and 20 years. An 18-year size with long sleeves, requires 5 yards 35 inches wide or wider. Price 15c or two for 25c.

No. 6559.—Misses' dress. Cut in three sizes: 16, 18 and 20 years. An 18-year size with long sleeves, requires 5 yards 35 inches wide or wider. Price 15c or two for 25c.

No. 6121.—Girls' dress. Cut in four sizes: 6, 8, 10 and 12 years. An 8-year size with long sleeves requires 2 1/2 yards of 36-inch material. Price 15c or two for 25c.

No. 6440.—Misses' dress. Cut in three sizes: 16, 18 and 20 years. An 18-year size with long sleeves, requires 5 yards 35 inches wide or wider. Price 15c or two for 25c.

HOW TO ORDER

Write your name and address clearly. State number and size of each pattern. Price 15c each, two for 25c. Send stamps or coin. Our Fashion Magazine will help in preparing your wardrobe. Copy only 10c. Address Pattern Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Since heavy, rich food is often difficult to digest and produces heat, rich gravies, fried foods, pastries and heavy desserts may well be omitted from the menu in warm weather. Substitute more fresh fruits and vegetables and cool fruit or milk beverages.

Hang up the kitchen utensils whenever possible. The egg beater, the small saucepan, or other utensils are much more accessible if hanging in sight than if kept in a shelf or in a drawer among many others.

TWO HELPERS INSTEAD OF ONE IN EVERY BAR
That's why

FELS-NAPTHA WASHES QUICKLY IN WATER OF ANY TEMPERATURE

FELS-NAPTHA is one soap you don't have to pamper. Use it your way. Boil the clothes or soak them, just as you wish—Fels-Naptha does a splendid job in water of any temperature. Yes, even in cool water, it gives you extra help!

Let your nose discover the reason. Unwrap a bar of Fels-Naptha and smell it. Know what that clean odor is? It's naptha—the safe dirt-loosener dry cleaners use. There's plenty of it in Fels-Naptha, combined with good golden soap. And these two cleaners, working together, give extra help that loosens dirt quickly and washes it away—making clothes sweetly clean without hard rubbing.

Try Fels-Naptha next washday. It works beautifully in tub or machine. It's great for household cleaning, too—for

woodwork, windows, floors. It loosens dirt so quickly that it keeps your hands in water less time. Which, of course, helps keep them nice. Ask your grocer for Fels-Naptha today.

SPECIAL OFFER—We'll be glad to send every user of Fels-Naptha Soap a Fels-Naptha Chipper. Many women who chip Fels-Naptha into their washing machines, tubs or basins find this chipper handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naptha) just as you need them. Send only a two-cent stamp to cover postage, and we'll mail you this chipper without further cost. Write today. Department 7-6-21, Fels & Company, Philadelphia, Pa.

The Story of Woodbine Farm

By W. D. ZINN
(Continued from last week.)

DOWN TO THE PRICE OF WOOD!

The man who introduced concrete stave silos into the East, and worked with them to the present day, offers the results of his experience in a much improved concrete silo. Geo. E. Priest's Reinforced Concrete Stave Silo has these advantages:

LOWEST PRICES—no more than many wood silos, delivery and erection included. PERMANENCE—QUICK ERECTION—LIBERAL DISCOUNTS—Send to us for a booklet describing the Priest Silo Improvements in detail.

WHY...of all SILO FILLERS Bought in Wisconsin 40% are GEHLS

Wisconsin dairymen, owning 20% of the silos of the whole U. S., appreciate the GEHL cutter's exceptionally superior points, including its big capacity at low speed, light running and clean cutting due to narrow, of knives, rollers, feeders, and delivery chutes. GEHL silos are built with a 40% GEHL cutter attachment. GEHL silos are built with a 40% GEHL cutter attachment. GEHL silos are built with a 40% GEHL cutter attachment.

Power Cost as Low as \$1.75 per ton. GEHL BROS. MFG. CO., 428 South Water St., West Bend, Wisconsin.

Get Rid of CANADA THISTLES

The Little Wonder Weed Destroyer will positively destroy them.

A spraying solution (not a chlorate) costs only 6c per gallon; will not burn the soil nor kill cattle. Write for free illustrated leaflet.

REBER CHEMICAL COMPANY Reading, Pa.

ON account of the failing health of my wife we were forced to leave the farm on the first day of November, 1920. The following winter was spent with our daughter in Ohio, but the author spent most of his time in institute work out in the state. In the spring we came back to Philippi, W. Va., and spent the summer there, living in town in rented rooms. Being scheduled for most of the winter in institute work we returned to Ohio in the fall of 1921 and again had a pleasant winter with our daughter.

We rented our farms to Mr. M. J. Morrison on a fifty-fifty basis. In the contract I reserved the right to share in the general supervision of them. In order to maintain their productivity I specified that certain rotations were to be practiced and certain amounts of fertilizers were to be applied, and I want to say here that in all the eight years the farms were rented there was never a disagreement as to their management. I was never out of touch with the farms and visited them frequently.

We kept pure-bred Angus cattle, and it was a real pleasure to go among the herds and watch them develop, but in 1921 we paid rather dearly for the pleasure. Our invoice showed that we had a loss of over three thousand dollars that year. There was quite a temptation to quit the business, but we were unable to stop and it would have been a great mistake to have done so. No matter what one's business is there will be lean years, and he is most successful who takes the bitter with the sweet and sticks to the occupation that he has chosen.

Dividends on Homes

After returning from Ohio each spring it was a real satisfaction to plunge again into business and assist in the active management of the farms. But it was a satisfaction equally great to lay aside the work in the fall and take up the task of speaking to the farmers in Ohio. Variety is said to be the spice of life.

The late F. L. Allen was the supervisor of the institutes in Ohio and it was always a great pleasure to work for him. I am sure that I voice the sentiment of every institute speaker in Ohio when I say that no state ever had a more faithful, efficient and unflinching leader. The state suffered a very great loss when he was called to his reward.

We could not become accustomed to paying rent. Many people do this all their lives, but they must be differently constituted. Each season we chafed more and more under it. During the summer of 1922 we purchased a lot on Main Street in Philippi and let the contract for the erection of a comfortable and modern house. It is of the bungalow style, has five rooms, a bath and two halls on the first floor, and three rooms, a bath and a hall on the second floor with a basement under the entire building and a vegetable cellar under the porch. The building has a wooden frame with brick veneering and this causes the house to be warm in the winter and cool in the summer.

The contractor suggested that it was unnecessary to put two baths in so small a house, but time and usage have proved that he was wrong and we have been glad that the second bath was installed.

My wife and I spent eight very happy years in this home and I am glad to say that we did it as we did. On February 2nd, 1929, she was taken to her reward and will occupy a house "not built with bricks." One of my pleasant memories is that during the last twenty-five years of her life she had two modern homes and was happy in them.

Some people say that the money we

put in houses we are to occupy will never pay us any dividends. That is true if money is the only dividend, but it is not true in respect to happiness, and who receives more and greater dividends than he who leads a happy and useful life?

Before we started the erection of the house on the farm or the one in town we had the money laid aside to pay for it. We make no mistake in providing ourselves with comfortable homes if in the building we do not embarrass ourselves financially. Had we continued to live in the old house on the farm and rented a house in town we probably would have had more money, but that money would have been of no benefit to the one who is no more. Invested in a suitable and convenient home she did get a lot of pleasure out of it.

Too Much Land

On the 10th day of January, 1929, Woodbine Farm was sold for \$25,000 cash or its equivalent. Included in this sale was a team and farm machinery worth probably \$1,000. Had we sold the farm before we left it, no doubt it would have been harder to give it up, but having moved away with no intention of ever moving back we could see it pass out of our hands much more easily. I asked a good friend what he thought of my selling Woodbine. "It is all right if you can be satisfied," was his answer. I had considered that very carefully before I made the sale and decided I would be satisfied, and thus I have not grieved over it since it was sold. I had come to a time in life when I was unable to do much active work on the farm. Besides, I do not believe that any one should work very hard in old age if he has been frugal and has laid by enough to keep him and his family, and this we had done. Note I say "we," for my departed wife had done more than her share in the "laying-by."

I am often asked whether I would pursue the same course had I my life to live over, and I always answer in the negative. Not that I have any serious regrets for having led the life I have. While I have been fairly successful many others have had much greater success in the same time. I made the very common mistake of buying too much land and spending the best of my life in paying for it. Had I been content with the ninety-three acres in Woodbine farm I could have made it more productive and attractive and by doing the latter I would have added to the happiness of my companion and would have had more time to give to her and others.

For thirty-five years I never had a dollar that I really felt was my own, for in all that period I owed more money than I ever had at any one time. Every one should strive, and that very hard, to acquire a competence; but after the competence has been gained the big thing in life is to render service to humanity, and being pressed all the time with debt one does not have the time and often not the inclination to be helpful.

We did not stop buying land until we had 620 acres and for a few years we owned 920. We had an opportunity to use all our energy on Woodbine, and possibly by concentrating our efforts might have accomplished much more. I wish to make clear, however, that not an acre of land was purchased without the approval of my wife. Why should I purchase land to pay for which she would have to have lived without her "rent"? The idea of farming today is that it is able to cultivate it properly. I once knew a farmer who owned 5,500 acres of land and the regret of his life seemed to be that he did not buy much more land while it was cheap.

(To be continued.)

BIGGER SUMMER MILK CHECKS with B-B 20% Hi-Test Dairy Feed

WITH green pastures, cows need a balanced ration for top-notch milk production. And with pastures slowly drying up, they need it more than ever.

Feed B-B Hi-Test Dairy Feed now. This economical 20% protein feed contains the right variety of minerals, vitamins and other needed milk producing ingredients. B-B Red-E-Mix is another excellent 20% dairy feed for summer use.

We Guarantee Most Production

The perfect balance of these feeds insures a longer lactation period and perfect physical condition. Feeding it now means maximum production both now and later on.

We guarantee B-B Dairy Feeds most productive per dollar of feed cost—or money back.

Farm and Dairy

By L. W. LIGHTY

ALL silos need some annual attention. Brick, tile and concrete become rough and often faults appear in the wall that allow the air to leak in. This must be prevented and the wall kept reasonably smooth.

My experience in helping to make all silo walls airproof convinced me that general rules will often not work in specific cases. An expert may be needed. To smooth walls and close small cracks I found nothing equal to cement mixed to a creamy consistency and applied with a brush.

The wall must be perfectly clean and moistened. The cement must be applied soon after it is mixed. In other days we applied a coat of gas tar. The only result was an awful bad smell and a black mess. Men of practical experience tell me if we use a good quality of asphaltum roofing paint we get good results.

Failures have been reported with the cement wash, but that was caused by putting the wash on too thick. I have waterproofed cisterns and silos in this way that gave good service for several years.

But the wooden silo wall needs treatment regularly for the most permanent and economical results. The outside wall surface should be kept painted with a good grade of barn paint. For the inside I never found anything equal to linseed oil applied when the wall is dry and well warmed up by the sun. The next best is common crude oil as it comes from the oil well. Several good applications of this surely preserve the wood.

Surface Cooler

"The temperature of my well water is 52 to 53 degrees and I pump it with a small engine. I use a corrugated surface cooler to pre-cool my milk. By pumping the water slowly through the cooler while the milk trickles over it I find the temperature of the milk as it goes into the can is sixty or below. I now place the can in a small tank with fresh pumped water in which I place a small quantity of ice. In a short time the milk is cooled to fifty or below. When I sell cream it is cooled the same way, only I chill it down to 45 or below. Pre-cooling it over the corrugated surface cooler saves me a lot of ice and time."

The above is part of a letter from a dairyman who also tells me he is trying to organize a cow-testing association and a bull club, neither of which he has any personal special need for, as he has a record of his cows and also has a pure-bred bull, but he is sure that if the farmers in his neighborhood would adopt more progressive methods he would be benefited, which is doubtless true.

Pasture Ten Days Earlier

From another letter I copy this: "At your suggestion I applied a light coat of manure and some lime and superphosphate to my pasture last summer. This spring my pasture was ready to turn in ten days earlier than usual and now it looks as though I would have twice as much feed as I ever had from this field."

Surely there is no lesson quite equal to personal experience.

In the Flower Garden

Much brings the snowdrops and tulips with a few others, and April brings the tulips and early iris with many others. The climax is reached by last week in May and the first two weeks in June.

Though we have iris by the tenth of April and peonies by the tenth of May the thousands and ten thousands come between the middle of May and the middle of June. Very often flowers are scarce by Decoration Day, but excessive warmth before the middle of May forced all growth and so this

year there was a wonderful abundance of flowers by May 30th.

The flower garden is as dependent on the weather conditions as is the vegetable garden or the field. A number of years' careful observation and a daily notation of weather conditions convince me that many varieties of iris and peonies as well as other perennials vary greatly because of weather variation.

I have an English origination, Lady Alexander Duff, that develops into an enormous and unmatched shell pink peony when we have cool and plenty of fog some ten days as the bud makes its last development. This was such a season and the block of Lady Alexander Duff topped everything for attraction in the garden of a few hundred varieties. Gigantic and glorious were common expressions.

Another variety originated on the western United States plains, Karl Rosenfeld, resents such English conditions and while usually one of the very finest reds it fails to show up real good this season. I might cite many examples just like these. They have inherited proclivities and characteristics that must be humored if we would get the best out of them.

Peonies and Dairy Cows

I cannot help but compare my peonies and their demands to my dairy cows of former days. The Channel Island cattle demanded Channel Island conditions if they were to do their best, while the Brown Swiss flourished on entirely different feed and treatment. While we cannot make the weather that suits our peonies we can with thought and effort closely approach either Channel Island conditions or Swiss conditions for our cattle.

I find my garden work fully as fascinating and interesting as I ever found the field and dairy barn work. Every year I have hundreds of new seedlings come forth. While many are worthless a few are improvements and once in a while comes something outstanding, something entirely different, something that brings a great thrill. I have no quarrel with the professional hybridizer, as he doubtless knows what he is doing, but I have proved and so have many others that selected seed, though produced under chance fertilization will rather often bring prize winners.

New and Improved Varieties

We have some very unusual and beautiful seedlings in the iris and peonies really different from varieties now under cultivation, but occasionally things happen that are very puzzling. We grew the rather old orange and pink oriental poppies for some years, but suddenly a seedling appeared giving us very brilliant rich scarlet blooms of extraordinary size. That made us marvel, because nothing in that color was ever grown on that ground. But a little later came the climax in Oriental poppy colors.

A chance seedling sprang up and when the large bloom opened it was a rich dark red maroon color with silky black markings on the base of the petals, while the petals themselves were very beautifully crinkled and ruffled. The stamens in a great circular mass are rich steel gray color and the pistil is a satiny garnet, making a combination that is gorgeous beyond words. But the great question is: where did it come from? Of course from a seed, but there were no seeds except from the orange and pink.

Indeed what we do not know might make many books, yet possibly a brief explanation might suffice. After all it is not possible that man has dominion to bring his ideal into manifestation? To me it seems we have plenty of proof of this in the animal, vegetable and the inorganic world.

EASY, CLEAN & FAST THRESHING

with a

FARQUHAR "ALL STEEL"

This is our new, modern Thresher. Embodies all the best ideas obtained from hundreds of successful threshers. It is so easily operated, its little power because equipped with Roller Bearings and Rocker Pulleys. Does a nice, clean job of threshing any kind or condition of grain. Has large capacity and built to endure the heavy strains of long hard usage.

Write for Bulletin 529 and learn the results of both threshermen and farmers.

We also build Engines, Bolters, Sawmills, Hay Balers, Cider Presses and Farm Implementations. Catalogs upon request.

Truck Crops

By GILBERT S. WATTS

ALTHOUGH the local strawberry crop is smaller than normal, unexpected heavy pickings at the end of last week resulted in surprisingly low prices late Saturday in the market houses. The public simply was not aware of the fact that home grown berries were available in abundance.

If the local berry growers coming into the markets of our small and medium sized cities could find a way to band together and advertise just as pickings become heavy demand unquestionably would be speeded up and to some extent focused on the period of peak harvesting. At least my own experience in advertising for my roadside market indicates that there are large possibilities in this connection.

Another factor in realizing largest returns from berries is to control pickings so that those made at the last of the week are not disproportionately large. It is our policy, since we do not pick on Sunday, to gather only the berries that are ripest on Monday. Tuesday we pick a little more closely. By Friday we take everything that is ripe enough to satisfy the trade. Thus daily totals are held at a fairly even level and we seldom are confronted with difficult surplus Saturday.

The Market Growers' Journal has pointed out that the price index for fertilizer nitrogen stands at 71 per cent of the 1910 to 1914 level whereas crop prices stand at 141 per cent and farm labor at 175 per cent. That makes it look like questionable business to let intensive crops that require much costly labor go the least bit hungry for nitrogen.

It is much easier to keep blight from getting a bad start in the celery. Thorough spraying with 5-5-50 Bordeaux at weekly intervals is both preventative and cure.

If the new shoots of black raspberries, the ones that will bear next year's crop, are pinched back as soon as they grow waist high both stocky growth and branching will be induced. Thus the necessity for trellising or staking will be eliminated.

Staked tomatoes produce the finest fruit when trained to a single stem. This is done by pinching out all laterals and tying the "leader" or main stem to a stake. It is important, as a means of conserving the strength of the plants, to remove laterals while they are very small, preferably not over an inch long. Stake tomatoes so trained may be set as close as eighteen inches by three feet.

Propose Grades for Milk

(Continued from page 5.)
Agriculture, the Department of Health, and other similar agencies. This Conference Board approved the recommendations of the dairymen and supported them at a public hearing held at the State House on May 6, 1930.

It is proposed to make these grades a part of the State Sanitary Code and negotiations are now under way to that end. Whatever may be the final outcome, there are two important developments that are worthy of note. The first is that the farmers of the state have recognized the importance of putting their own industry on a sound economic basis and have taken the initiative in this most important, though difficult, field. The second factor that has been developed is the unity of interest that prevails, although it is sometimes clouded with prejudice, among producers, distributors and consumers. The constructive efforts of the dairymen along these lines have met with interest and support from nearly all other agencies engaged in any phase of the milk industry. These two factors are certain to prove of lasting benefit to the dairy industry of the state.

The Cost is LOW So All can GO On This Wonderful Trip

On the PENNSYLVANIA FARMER Tour

to Glacier National Park, the Pacific Northwest and Yellowstone

PLAN NOW the pleasure trip of your lifetime—a vacation treat for yourself and family. Go on the wonderful, educational sight-seeing Pennsylvania Farmer Tour to the great Glacier National Park, the Pacific Northwest, wondrous Yellowstone Park and cool colorful Colorado, at a cost lower than you ever imagined!

This tour is offered you through the cooperation of the Pennsylvania Farmer and five of America's greatest railroads. It's a trip you'll always remember and it takes place just when you can best get away—July 26 to August 10.

2 Weeks of Joyous Travel

Picture a place where Nature has done one of her most lavish pieces of handiwork and where man has created the world's finest resorts—that's the Pacific Northwest and it is calling you this year.

You travel on all-Pullman trains with every comfort and convenience possible to give you. You visit the last home of a vanishing race—the reservation of the Blackfoot Indians—Glacier National Park with its riot of color and awe-inspiring greatness. You travel on the Pacific Ocean by C. P. Steamer from Vancouver to Seattle, stopping off at Victoria. You gain intimate knowledge of the Northwest's cities, and view the scenic grandeur of famous Yellowstone National Park.

Mighty forests, lofty waterfalls, towering mountain ranges await you all the way. Auto sight-seeing side trips make every day more interesting. Let's go!

Off to town with Ethyl

WHEN the day's work is done and you drive to town to the movies or to shop, you get there quicker and easier with Ethyl in your tank. That is because Ethyl Gasoline is gasoline *plus*. It is good gasoline to which leading oil companies are adding Ethyl fluid, the anti-knock compound developed by General Motors Research Laboratories to improve motor car performance.

In your passenger car, your tractor or truck, Ethyl gives you extra power, quicker pick-up, and lessens gear shifting. You cover more ground in a day, there is less wear and tear on your engine, fewer repair bills and slower depreciation. Time and money are saved, and it is easier on engine and driver when you are using Ethyl Gasoline.

Give Ethyl a trial in all your motor equipment. Wait until your tank is nearly empty; otherwise the Ethyl will be diluted and its effectiveness lessened. Then fill up with Ethyl. It will save you time, labor and expense. Ethyl Gasoline Corporation, Chrysler Building, New York City

The active ingredient used in Ethyl fluid is lead.

ETHYL GASOLINE

Farm Facts and Fancies

By ALVA AGEE

A KANSAS farmer tells me that his acreage of wheat must be kept big to hold down the expense per acre when money is invested in a combine. After charging off for use of the engine on the corn crop and some winter work on feed and wood he figures that he must seed five hundred acres to wheat to get a satisfactory return on investment in the harvesting outfit. That is his figuring, and of course I know nothing of its correctness, but the thing interesting me is this broad influence to extend acreage so that modern costly equipment may not lie idle more than is necessary.

More and more these grain farmers have the point of view of the manufacturer who knows how costly it is to shut down when prices are low and rather inclines to increase efficiency, have a greater output and spread costs over a larger amount of goods marketed. Certainly the introduction of better farm equipment every year increases the production of all kinds of grain, and this is aside from the great area in newer farming sections that can yield some profit from relatively small yields per acre through the use of tractors and big seeding and harvesting machines. While the Farm Board figures, these men go ahead and plant.

The Inevitable

Oil, copper, sugar—these three commodities have a great excess of potential production, and permanent control is not a reasonable thing to expect. New bodies of oil continually are found. There is a great amount of copper ore accessible. Cheap labor lets foreign countries pile up beet and other sugar. Now, there is a fourth product that belongs in this list, and well up to the head. That is wheat. It is easy to grow, it lends itself to the use of machinery in the highest degree, it is easily stored, it is a cash article.

Potential production is nearly beyond calculation now that modern equipment can be taken to regions where the crop would not be seeded if much human labor ran costs up. Yes, we do well to class wheat with oil and copper in our thinking. Of course there are best marketing methods for everything, and that includes wheat. But the possibility of price control and of much net profit from the crop in the United States fades more and more as time comes along. World overproduction of wheat is seemingly inevitable.

On Eastern Farms

And yet, it does not appear probable that all manner of competition can drive wheat out of its place on the farms east of the Mississippi river. It fits too exactly into farming plans for that. It makes a good yield on land after other plow crops have taken the best out of the sod that was turned down. It is a good crop with which to seed down to grass and clover. It provides work for teams and tractors at times when they otherwise would not be used. It provides straw, and be the price ever so low it is a cash crop and that counts for something.

Argue as we will, the chances are that wheat will stay in eastern farm rotations wherever so far it has fit nicely. The prospect of continuing low prices, excepting the normal ups and downs, is only another hardship that will be accepted because dropping the crop promises nothing better.

Actual Plant Food

I have a neighbor who clings to the idea that commercial fertilizers are only stimulants. Twenty years ago a considerable percentage of farmers held the same belief. It was worth while to convince my belated friend, and the means were simple enough. Some clean seashore sand had been put into pots, and in some of them rye was seeded without any fertilizer

In other pots a high-grade complete fertilizer was used at the rate of six hundred pounds per acre.

During the first three weeks the plants that had no fertilizer fed on the seed grains and made a fairly brave showing. Then they began to lose ground. The fertilized plants are making a thrifty growth and the contrast is surely striking. Now, there was little basis in that sand for any stimulation, and I called my neighbor over to see the growth in some pots many times greater than that in the others. It gave him faith for the time being.

Our Land Banks

I wish farmers were a unit in seeing that only close governmental supervision of our whole land-bank system can make money available to them at the lowest interest rate. It is only a sense of certainty about investments that makes people willing to accept a small return on their money. That is the reason government bonds carry so low a rate. Bonds of land bank banks would be marketed today at a lower rate, and money loaned on farms at a corresponding reduction, if government regulation had been so rigid that a few banks would not have got into difficulties.

The substance of the whole scheme lies in some approach in land banks to the safety of government bonds. Any step in that direction means less interest to be paid on mortgages. If supervision had been closer, the gap between rates on these two classes of bonds would not be as wide as it is today, but great good has been done, and especially in states that are remote from money centers and had high interest charges on farm loans.

We can go much further in reducing the rate on farm mortgages by increasing the certainty that investors in the untaxed bonds will not lose any of their capital. The system is in the interest of the farm debtor, and the rate he must pay in the future depends on such close governmental supervision that there will be a market for land bank bonds at low interest rates.

Reducing a Sense of Burden

If a farmer owes half what he is worth, he carries a heavy burden. What he needs is a low interest charge on the amount he owes, a certainty that the lender will let the mortgage run and a realization that the amount paid annually with the interest is gradually wiping out the debt. The land bank system provides this, and the outlook becomes decidedly brighter. If he owes more than half, he must make other provision for the remainder because the vital thing in the system is that the money loaned on the mortgage be secure that the bonds that produce the money carry a low interest rate.

New Bait Gets Beetles

AFTER two years of experimental work at the Japanese beetle laboratory at Moorestown, New Jersey, entomologists have developed a bait for Japanese beetles which is much more effective than that commonly used heretofore.

The formula for the new bait is as follows: four teaspoons of geraniol, one-half teaspoon of eugenol, one and one-half cups of bran, one tablespoon of water, two and one-half tablespoons of molasses and one and one-half spoons of glycerine. This makes about one-third of a pound.

Certain types of traps have been baited with this mixture and have held more than an ounce of beetles. The quantity of the attractive agents used in these traps are necessarily very small. The United States Department of Agriculture entomologists recommend for such traps the use of as much geraniol and eugenol to 25 grains of the plain bait as is recommended for the larger quantity.

On the HOTTEST DAY you may have COLD FURNISHED BY WIRE...

This refrigerator makes a saving in steps and food worth many dollars on a Pennsylvania farm

FARM women are again confronted with the hot weather problem of how to keep their food from spoiling. The electric refrigerator is the answer to this problem of how to keep the food constantly cold enough. Only those who have been confronted with this task for years and now enjoy the use of an electric refrigerator, can appreciate what it does.

Saving Thousands of Steps

On most farms the food must be taken to the spring house or cellar in an attempt to keep it from spoiling. This commonly means two trips before and after each meal or twelve round trips a day. If the spring house is 100 feet from the kitchen this would mean walking almost 15 miles per month or about 5 hours of solid trotting, chiefly by mother. Even at 30c per hour, which is too low, this would amount to \$1.50 worth of labor per month.

Dollars Worth of Food Saved

Primarily the electric household refrigerator was designed to save food and health, the saving of steps being only incidental. It has proven its worth for food preservation to such an extent that its use has swept over the country until there are now hundreds of thousands in use.

Farm housewives tell us they like the electric refrigerator because:

... It brings the cold to where the food is.

... It saves steps in taking the food to a cold place.

... It keeps the food in much better condition, maintaining a uniform temperature of 50° or less.

... The separate cold compartments provide ice and cool drinks for the hot days in the summer.

... No food is wasted by spoilage.

... They can save trips to market and buy at a lower price by purchasing in larger quantities perishable food that would otherwise spoil.

... They can prolong the season for use of home grown perishables, particularly berries and fruits.

In order to get the most satisfaction from electricity it is important to have an adequate wiring system with outlets placed conveniently for a washer, sweeper, iron, percolator, toaster, refrigerator, electric range, motors, etc., in addition to lights. We shall be glad to have a representative confer with you regarding how your wiring system should be laid out preliminary to securing bids from reliable contractors. There is no charge for this service.

... Of freedom from messed up floors in bringing ice from the ice house.

... They do not have to interfere with the men in their farm work to ice the refrigerator.

... The food looks tasty and is better when served.

Costs Little to Operate

Rate schedules are worked out so that after a certain amount of current has been used the cost is greatly reduced. The cost of current to operate an electric refrigerator commonly ranges from \$1.00 to \$3.00 per month. Since the farm housewife will wish to keep relatively large quantities of food it is desirable to have a refrigerator with sufficient storage space. While the cost of operation will be somewhat higher for a larger unit the service rendered will more than offset this. Your electric company will gladly advise you as to the size of refrigerator most suitable and what the current would cost for operation.

Ask the woman who has an electric refrigerator; we believe she will tell you that the cost of current is very small in comparison to the value of the food saved, the steps eliminated, the health protection secured, plus the satisfaction of cool drinks and tasty, attractive food from the electric refrigerator. Another proof that

Grower Insures 100-Acre Potato Crop with Pyrox

"I USED Pyrox on my 100 acres of potatoes this season and dug approximately 150 bbls. per acre, entirely free from rot, and suitable for fine seed," writes Mr. Frank L. Longstaff of Island Falls, Me., under date of December 10, 1929. He says: "Experience has proved to me that proper spraying is potato insurance through the entire growing season. I find that Pyrox mixes more easily than home-made Bordeaux, stays in suspension for many hours after mixing, spreads readily, and sticks to the plant most satisfactorily."

Mr. Frank L. Longstaff of Island Falls, Maine

Other growers report equally satisfying results with Pyrox. Pyrox is a combined insecticide and fungicide, scientifically prepared to kill bugs, control blights and other diseases, and to stimulate plant growth. Safe, quick,

easy to use. Does not clog nozzles. Economical because it goes far, gives complete protection. Packed in sizes to suit every need. Now priced lowest in 31 years. See your dealer now, or write us for the free Pyrox Spray Guide. Learn how Pyrox can help you get bigger yields and more profit from all crops.

Sickness, Suffering and Sorrow Trail

... THE FEARFUL

These foul, contaminating insects are bound to invade your home. Be ready for them. Have FLY-TOX on hand. This pure, clean, fragrant, spray is sure death to the Fearful Seven. There is only one FLY-TOX. Refuse substitutes.

FLY-TOX

KILLS THEM ALL
Absolutely Harmless to People and Animals

... and STOCKAID, too ...

Splendid for livestock. Kills flies, mosquitoes, fleas and lice. Keeps insects away for hours. This scientific spray will not blister hide, gum the hair or clog the sprayer. It is stainless. Will not taint milk when properly sprayed. Has pleasant odor. STOCKAID is the ideal animal spray. Used in many of the largest dairy barns and stock farms in the country.

NESHAMINY GARDENS

By R. P. KESTER

IT is said that the price of farm land has begun to go up on the average. For five years land prices have been going down steadily from the high point of six years ago. This was but a repetition of past history. Everything seems to "undulate" in value, going from high to low and back again from low to high. This is true of land values, interest rates, stock values, wages, etc. The unknown element in the present situation is whether there will be a movement of population back from the city to buy land and take up farming, such as has occurred in the past when slack times occurred? My opinion is that there will not be.

Why does the price of land vary with the changing decades? What sets the value of land anyway? Do the same reasons exist in relation to land as exist in the case of stocks, factories, mines and railroads? Is the price of land gauged by the net profits from it? Or is the value of land enhanced when it is enhanced, by reason of its location with reference to other things? Here is a hypothetical story that will illustrate the question:

John Brown and James White were two young men who bought farms fifty years ago. John Brown bought 150 acres containing some timber, much good farm land and many other natural advantages. James White bought the same number of acres, and obtained identical resources. The farms are located about one hundred miles apart. During the fifty years about the same amount of labor has been expended upon them. Today, they have the same number of acres cleared and contain the same kind of buildings. Each man paid thirty dollars per acre for the bare land. On both farms families of five children were raised. When the two men bought their land one location seemed to be as good as the other. Neither one could be credited at that time of having superior foresight or insight.

But time and circumstances have made a great difference in the value of the two estates. John Brown's land sold recently for two hundred dollars per acre, or thirty thousand dollars. James White's farm would not bring more than five thousand dollars. How was the twenty-five thousand dollars difference made and who made it?

Sometimes you and I lose heart. think we never can be good and true in our living. I have heard one woman say a good many times, "If I only could live right one just one day!" Who of us has felt the tug of a longing like that? And because we fall sometimes are down in the mouth and feel giving it up.

But who of us is so good a farmer that he can always keep the plow in the furrow and never make a mistake? It is a lifelong struggle to win the prize. There is in any line; and yet, a Helper walks always by our side, when we falter. He puts His hand under our arm, and keeps us from falling. If we listen we hear His voice saying, "Fear thou not, for I am with thee!"

And so the white feather at last fades but of the black bird's wing.

have nothing as yet because the farm does not sell at any price.

I bring up this question merely to show that land values are influenced by other things than productive capacity, and that the varying financial success of farmers is not entirely due to varying financial ability.

Now I know that I will hear from some of my single-tax friends, if I have any. They will say that, since the public made the value of the Brown place the increment belongs to the public; that the taxes on a place should have gone up with its rising value and absorbed it. What maybe so. What do you think?

Friendly Talks

By Edgar L. Vincent

YOU cannot breed a white feather out of a black hen's wing.

Take as long as you wish, use every means possible, exercise all the skill and patience you are capable of, still that white feather will show the plumage of the black hen.

We might draw all sorts of encouraging lessons from this fact of nature. You can think of some of them just now. Some of them will be true and susceptible of proof, and others are very far from true.

But it is as true as anything I ever said or thought that there is no man on top of this green earth who may become a good man if he sets about it. A poor farmer may change his ways of working that will be the best tiller of the soil in the neighborhood. The dishonest man may get to be honest. The profane man may stop his swearing and his ways speak words that are clean and pure.

The Dove in the Hen-Hawk's Nest. A man and his wife lived near on the farm. The least said is soonest mended; but they had one of the dearest, sweetest little girls I ever saw. How it came about, only knows that made us all. They used to come to our house once while and always when they were just because they brought that one with them.

Sometimes you and I lose heart. think we never can be good and true in our living. I have heard one woman say a good many times, "If I only could live right one just one day!" Who of us has felt the tug of a longing like that? And because we fall sometimes are down in the mouth and feel giving it up.

But who of us is so good a farmer that he can always keep the plow in the furrow and never make a mistake? It is a lifelong struggle to win the prize. There is in any line; and yet, a Helper walks always by our side, when we falter. He puts His hand under our arm, and keeps us from falling. If we listen we hear His voice saying, "Fear thou not, for I am with thee!"

And so the white feather at last fades but of the black bird's wing.

Loss T. B. in Hogs

A 20 per cent decline of tuberculosis in market swine at the large packing centers is shown by Federal meat-inspection records. Eradication of tuberculosis among cattle on the farms where the hogs are raised is the reason for the improved condition of the hogs, officials of the United States Department of Agriculture believe.

The Case of Mike Finnegan and Joe Krusniewski

The Agricultural Problem as a Monongahela Valley Farmer Sees It

By WAITMAN DAVID

RECENTLY in reading a life of Mark Hanna I came across an interesting statement concerning the development of the Reclamation Service. It was reported that when that great man in his infancy, President Roosevelt called Mark Hanna to his aid and asked him to help in winning some of the eastern senators that there was such a place as Arizona.

Now in the days of the farm aid legislation would he be out of place to mention to some of the eastern and middle western senators, and the farmers there as well, that there is such a place as Pennsylvania?

In the last several years when "Farm Relief" has been so much discussed the eastern farmer has come in for criticism from his brothers in the West as well as from his industrial representative in Congress.

Seeing the effect of the ups and downs of the large industrial corporations on the demand for farm products, we eastern farmers have never been able to support many of the cure-all schemes that have been advanced.

Where can the correlation between the industrial East and the agricultural West be studied better than here in the Monongahela valley? From the source of the Ohio at Pittsburgh to the end of the West Virginia section is some one hundred and fifty miles in length and extends from the mountains in the east, to the Ohio Valley on the west.

Here we are typical of many eastern river valleys. We have some of the world's largest industrial developments and a population consuming in three to twenty times what the local agriculture produces. Here is demand, and after all said and done the success of agriculture is in direct proportion to the demand for its products. Here times are either good or bad. Why? Well, I ask any superintendent or executive and he will tell you all about the overhead, upkeep of machinery, replacements, etc. He will inform you it is better to shut down than to run at a loss. When business picks up they can be up to their minimum profitable production in a couple of weeks or a month. This is one universal method of big business impossible for farmers to use.

So almost over night the mills and factories may shut down. The mines supplying them shut down. Then the transportation system, of water, lays off a few hundred men.

Glad to Knock You Down

Some of the statisticians will say that practically the same population is found in one of these districts at other times are good or bad; that they have to eat, so they will counter the same amount of farm products. If these theorists would wait a few months in the Monongahela valley they would soon see differently.

Let's follow Mike Finnegan a few months. Mike is a good stocky Irishman about forty years of age. He is a tough steel worker, would as easily knock you down as look at you if you can do it. You can find him any place along the lower river, to his job, scornful of his boss, actually hating the capitalist who directly employs him when he takes time to think about it.

Mike is a hard worker and when he eats he eats in quality as well as

quantity, as do the seven—or is it eight now?—other members of the family. Pork chops they buy by the loin, bread by the dozen loaves and other things in proportion.

"Mike is working hard, the mill is running overtime with orders six to eight months ahead. I know it costs an awful lot to live these times," Mrs. Finnegan will tell you. "But we have a big family and I always like to have plenty whenever we can."

And so while Mike is drawing his ninety to a hundred and forty dollars every two weeks the Finnegan consume in a way that really creates demand. They are good for a two-dollar sale most any time the huckster selling California grapes, Texas tomatoes, Washington apples and Florida oranges calls. The local farmer can sell them four or five dozen eggs a week, a chicken now and then, and maybe a half a hog in the fall.

No Work, No Money, No Butter

Then the mill shuts down. No orders for steel. Follow Mrs. Finnegan to the store after Mike has had a pay some place where he has struck a temporary job. You will hear her say: "Here, Mr. Schmidt, is twenty dollars on the bill. I would like to give you more but Mike only gets three-and-a-half a day working for that contractor, and it costs so much for gas to go way up there in the country to that new road. We have to pay every month on the car or they will take it away from us. Send me up a hundred pounds of flour and a strip of salt side, two pounds of that thirty-cent coffee and a roll of oleo. I don't like that stuff but we can't afford butter."

"Say, Mr. Schmidt, you talk to some of the farmers when they come in and see if you can get me four or five bushels of little potatoes cheap. Maybe I could get some one to trade me a bushel for Bounce. He'd make some farmer a good watch dog. The children like him so well I would hate to see him not treated well but we can't afford to feed him the way times is. I don't know what we would have done the last three months if you

hadn't give us tick. They say after election the mills is going to start up again."

"That's all right," responds the storekeeper. Mike always buys lots and pays good when he has good work. I let you have what you need while I can. But I tell you true I put a mortgage on my building for thirty-five hundred dollars last week. The wholesaler and the produce man want cash and never give me more than thirty days time. You pay me as much as you can."

So much for Mike and demand. Let's look at his brother George who went railroading when he was nineteen. George would never be out of work if he had not lost his rights on the road when he went into the mills for two years during the war to get the high wages. But now when the mills shut down George got furloughed. They laid three crews off the "Branch" because there was not enough coal being shipped to run the trains. Then, too, some of the crews that were laid off on the main line came back on the branch and bumped younger men off their jobs.

Of course George has money in the bank and owns his own property, but he is getting along on the sixty dollars a month he receives looking after a filling station on the Pike and that will close down when winter sets in again.

There is another brother. Hen. He lives on up the river and is a coal loader. You should see a delivery truck pull up to his door about twice a week and unload two or three big baskets each trip when Hen is getting his six or seven wagons a day steady. Then go around after the mine has been shut down three months. Those twenty prize Wyandottes he was buying feed for have all been eaten, save eight he sold to get the girls some shoes so they could get to school.

Hen has but little credit, for when he has no coal standing at the office the store shuts down on him. He just has to get along on what he can make loading two or three wagons a day at a small mine that is shipping spot coal to a pier at Baltimore.

"But still you can make enough to eat if you don't eat too much," is the way Hen expresses it. "They say the big mines and the mills are going to start up in the fall."

But up this valley you will find others besides the Finnegan and the Doughertys. There is a small group of McDonalds, Smiths, Browns and Olsens who buy about the same amount regardless of times. They keep about the same standard always with never a feast nor a famine.

But most of these people spend as they earn, as does the colored population which increased greatly during the last strike period.

And of this vast foreign population let's see how Old Joe affects the demand for agricultural products. Joe came over from some place near Krakow in 1900. He spent seven years laboring around the mills up the Lehigh Valley. Then he moved on west and worked in the hard coal mines where he was married. He came on over the mountains in 1914.

Joe loads his five and six a day when the mines are running, save a day now and then when he stays home to "drink little bit." His wife keeps two to five boarders so they are generally feeding twelve to fourteen. And do they eat? I'd just like to take you over to Joe's some time after pay day when they have a roast "piggy" with trimmings.

(To be continued.)

This fleet belongs to one of the large cooperative egg marketing organizations of the Pacific Coast. The trucks bring the eggs to central points for grading and packing then start them on their way east to top the New York market.

NO CONTRACTING

IN recent years most of the range lambs and many range cattle have been contracted in advance by feeders. This time both lambs and cattle have lost plenty of money and in consequence very little contracting has been done. Probably more feeder lambs and cattle will go to market the coming fall than for several years. At least there is no rude hurry on the part of feeders to contract them in the range country.

THE GENTLE KILLER

LAST week John A. Mayers of Winslow, Ill., went to the pasture to drive in his cows. As he did not return promptly others went to the pasture, where they found him dead, with evidence of a struggle with his two-year-old bull. The correspondent of the Drovers' Journal who reported this case says: "The bull had not been cross and does not seem cross now after the accident. I saw the bull in the barn and he seemed perfectly quiet for you to go about him." The old, old story of a quiet bull which suddenly becomes a murderer!

PROBLEM SOLVERS

THE editor of a popular magazine is going to help solve the problem of surplus food production by teaching everyone to play golf and using most of the rolling farm land for golf courses. Another problem-solver will have all the hills reforested. A third will give every farmer an airplane and turn the level land into flying fields. Then when barnyards are turned into tennis courts and vegetable gardens into croquet grounds farm relief will be complete. We shall let the Russians grow our wheat and the Argentinians our meat. As for money to pay taxes and buy golf balls and gasoline—well, why worry about a little thing like that?

TO DOCTOR BABCOCK

LAST year Senator Arthur Capper established an annual recognition of some man distinguished for his service to agriculture. The committee has decided that the first award, five thousand dollars and a gold medal, shall go to Dr. Stephen Moulton Babcock of the University of Wisconsin, the discoverer of the method of testing milk known as the Babcock test. This award is creditable to the recipient, the donor and the committee who selected the man to be honored. Dr. Babcock, who as a public servant gave to the public an invention from which he could have

made a fortune, is worthy of the highest honor and of the esteem universally accorded him. Those who provide proper recognition of such men and such service honor themselves in doing so.

WHY FAILURE?

THE United States Department of Commerce has been analyzing the business failures of a group of Philadelphia grocers. Most of the bankrupt retailers kept no records, took no inventory, speculated in real estate, did not use scientific methods. The Department's report reads much like an analysis of farm failures. Apparently there is little difference between the fundamentals of growing beans at wholesale and selling them at retail. Some day we hope the Department of Commerce or some other department will find and publish the reasons for success.

NO INFORMATION

ONE day last week the market reports recorded the "notable steadying effect" of an announcement, credited to the Chairman of the Federal Farm Board, that the Grain Corporation's wheat will not come into the market as long as prices remain at the present low level. Amid the many uncertainties of a slumping market such an announcement should have such an effect. But why should the public have to depend on an occasional utterance of this kind? The Federal Farm Board and its subsidiaries are public bodies, entrusted with extensive powers and large amounts of public money, and they should be compelled to make full and regular statements of their transactions and their policies. In no other way can be avoided the demoralizing effects of doubt, fear and suspicion which arise from lack of information.

PAID TOO MUCH

SEVERAL Australian creamery operators have been fined for paying too much for cream. That sounds rather queer, but it was according to law. For the purpose of improving the quality of butter for exportation Australian law says that all cream must be graded and must be paid for according to grade, the difference between the prices for the several grades being specified. It was proved that the defendants had not paid according to grade, in fact had paid as much for second grade as for first, and they were fined \$5 and costs each. They declared that they could not pay according to law and continue in business but that plea was without avail. Maybe they can find some way to get more of their cream into the first grade.

EDUCATIONAL QUESTIONS

WE are told by the United States Office of Education that rural school disadvantages are a hardship to the farmers of America, and statistics are given to prove it. Perhaps we should not generalize either in assertion or in averaging statistics on so broad a subject. It may be that in some states the term of the rural school is too brief for best results. We do not believe it to be so in the states in which this paper circulates. On the other hand we believe that in many urban schools the term is too long for best results. Is there not in education as elsewhere the possibility of too much of a good thing as well as too little? And are not our educators always striving for more rather than trying to determine the right amount? Why leave education so largely to educators, who of necessity view the problem entirely from their own standpoint?

THE LANCASTER SHOW

IT was unfortunate that the Lancaster Fair Cattle Show was held at a time when the coolers were so full of beef that the president

of the Chicago Livestock Exchange issued an appeal to feeders to withhold shipments to market. For an auction sale follows the Show and the 2,500 fat cattle had to go at money losing prices. The Show brought forward high class of cattle which deserved a better market. The owners voiced no complaint, though their losses were severe. They are the business to stay and they know that good years will come for those who keep on. The Show had a better attendance than last year but not what such an array of prime beef deserved. Lancaster should have had thousands of visitors last week instead of a few hundreds. The commercial organizations of the city should recognize the possibilities of such events and see that they are properly supported and advertised.

MODERN CATTLE THIEVES

OVER three years ago, under the able title, we warned our readers against the gang of swindlers operating in the vicinity of Fairfield, Ia., and discussed their methods of separating the confiding feeder buyer from his cash. At the same time we called to the attention of federal and state authorities the operations of these thieves. A few days ago thirty-five men in that vicinity, some of them said to be leading citizens, were indicted in conspiracy to defraud and false pretense in securing railroad records, that in two years and five months this gang had made over 1,200 shipments amounting to about \$3,000,000, but its operations have been carried on for many years and these figures must represent only a fraction of the totals. We hope that the Iowa authorities can convict all of the guilty ones and give them a chance for an extended period of reflection in a safe place. They have not only swindled hundreds of cattlemen but they have made all buyers wary of dealing with those who advertise stockers and feeders for sale, an injustice to many honest men.

A COTTON CORPORATION

THE Cotton Stabilization Corporation will be inaugurated with the same hopes as the Grain Stabilization Corporation. Both are likely to run much the same course during which the fallacy of the basic plan will be demonstrated by experience. All it will take time, and during that time many claims will be made as to the advantages and disadvantages of such institutions and the acts. Already the Grain Corporation claims that it has prevented a more serious decline in wheat. Nobody can definitely dispute the claim because nobody knows what would have happened if there had been no Grain Corporation. Against its claim of having saved the price are charges that it has mislead producers as to probable prices; that it has eliminated support which the market might have received from domestic and foreign buyers; that it has hung a weight on the market by accumulating a big supply to be disposed of at some uncertain future time and price; that its unknown and probably exaggerated holdings and its secret transactions have created a lack of confidence on the part of business men which has caused them to limit their operations; that it has unsettled the market instead of stabilizing it; and that all this is contrary to the interests of all concerned, including producers. Here again no definite claims can be established, for nobody knows what might have happened if there had been no Grain Corporation. This whole stabilization scheme may be expected to work out in similar attempts have done at other times in other places. Commercial history shows that all such efforts have finally been abandoned because of general recognition of the fact that they resulted in more harm than good.

HERD improvement associations of 32 states have proved 914 sires to the first of this year. This number E. J. Perry, dairy specialist at the New Jersey State College reports that only 112 were living, 622 were dead and no record is given concerning the other 180 animals.

In 1929 these associations proved 279 sires. Only 40 of these are living. One hundred thirty-nine were reported dead, and although no information was given about the remaining 100, it is thought that they also have been slaughtered.

These figures again bring out the fact that dairymen are sending good herd sires to the butcher before they know their true value. Many owners say that they do not want to keep an aged bull in their herd because it becomes dangerous and a menace to human life. Their argument can be answered by the careful handling of such bulls, by the construction of a safety bull pen.

A GROUP of Maryland farmers recently received certificates of merit in recognition of their accomplishments in agriculture. These awards were presented by the University of Maryland on Commencement Day, June 10, to Edgar R. Pennington, Kent county; W. H. Holloway, Worcester county; E. Watkins, Anne Arundel county; and C. Heurich, Montgomery county.

All of these men are outstanding dairymen and have devoted much time and effort toward bettering agricultural conditions in their communities and in the state.

POTATO Field Day, the annual get-together of New Jersey potato growers, was held this week, June 24, at the farm of Jesse Coleman, Lawrence Station. Demonstration of potato machinery and discussion of sprout and disease problems have always made this an event to attract a large group of growers.

ON Monday the Salem - Cumberland Fair-Hill Club Camp opened at Camp Roosevelt on the farm of Jesse Coleman, Woodstown. This is the first year these camps have held a Four-H camp and it is filled to capacity. Camp Roosevelt, a Boy Scout camp, was chartered for four days. Here 69 boys and girls from Salem and Cumberland counties are enjoying four days of camp life and receiving further training in rural leadership. Among the things they are being taught are first aid, leatherwork and rope and harness work. They are also studying useful and harmful birds and insects and practical farm forestry. One of the New Jersey State Troopers spent one day at the camp giving instruction in rules of the road and safety first helps.

NEW JERSEY county and state fairs have announced the dates which they will open as follows:
Hudson Fair..... August 26, 27, 28, 29
Ram County Fair..... August 27, 28, 29
Union Tri-State Fair, Aug. 31, Sept. 1, 2, 3, 4, 5, 6
Garden State Fair..... Sept. 17, 18, 19, 20

WICOMICO county farmers and their families will picnic in the Old Camp Grounds at Parsonburg on June 26. Between 200 and 300 people are expected to take part in the Wicomico County Picnic.

GROUP of about 60 Eastern Shore farmers plan a three-day visit to the New York market next month. They will leave on July 14. Upon arrival in the city the following morning they will visit the Pennsylvania produce terminal, a building covering ten acres where 725 cars of produce are handled daily.

At the Erie piers large shipments of Western fruits will be seen. A trip through the Washington Street Market, the wholesale commission market where much of the Eastern Shore fruits and vegetables are sold, will not only be a colorful

New Jersey Farm Comment

By G. W. HARRIS

event but will be a place worth spending some time and study. Here the growers may learn many things about grades, packages and the demands of the city consumers. It is here that many new and strange fruits and vegetables may be seen. This market supplies the demands of a cosmopolitan group, rich, poor and people of nearly every nationality.

The push cart market in Old Orchard Street in the lower East side of New York offers another interesting marketing scene to the farmer. In this congested section 2,000,000 people living within one square mile buy from push cart owners in the street. Later the visitors will tour the city and go sightseeing by tug boat around New York Harbor.

BURLINGTON county's first auction market for the sale of fruits and vegetables opened on Monday with beans being the principal commodity

The State Dairy Committee which serves as an advisory group on disease control and standardization problems in New Jersey.

offered for sale. This market is being operated by the Beverly Cooperative Growers' Association at Beverly, a successful growers' sales organization which has been in operation for several years. Formerly they shipped direct to New York commission men and this is their first attempt at the auction type of selling.

This organization will continue their former marketing system, giving the farmers the privilege of consigning their produce to New York as in the past, or sending part of it direct and selling part of it at the auction.

NEW JERSEY fruit and vegetable growers should keep in mind the two-day tour of Delaware and Maryland orchards and vegetable growing sections on July 1 and 2.

Among the outstanding points of interest on this trip will be the W. L. Smith Orchards which includes 400 acres of apples, mostly winter varieties, and 50 acres of peaches. A modern cold storage plant at this farm has storage capacity for 70,000 bushels of fruit.

The tour through the Dover section and from there to Ocean City will pass over 2,000 acres of apples and 700 acres of peaches. Harvest of Yellow Transparents will be under way in many of these orchards.

Harris' Nurseries, Inc., at Berlin, Maryland, own and operate over 5,000 acres of land, 1,750 acres of which are planted to commercial peach and apple orchards. Approximately 2,500 acres are devoted to growing nursery stock. An interesting feature at Harris' orchards is a block of 2,000 Elberta peach trees 30 years old with at least 95 per cent of the original trees still standing and producing a crop this year. A heavy crop of practically all varieties of apples will be seen in the Harris orchards.

FIVE New Jersey poultry owners are listed with high scoring White Leghorn flocks during the thirty-seventh week of the Vineland Egg-Laying Contest. The entries of C. W. Brown, Vineland, and Percy B. Niece of Raven Rock each laid 59 eggs to tie with a Pennsylvania flock for second place.

Flocks owned by the Circle Poultry Farm, Mullica Hill, and Stern Brothers, Vineland, are among the five pens tied for third place with scores of 57 eggs for the week. Harold A. Leghans' entry from Beverly took fourth place with a 56-egg score.

Rhode Island Reds from the Woodview Poultry Farm continue to lead all other New Jersey flocks in the Vineland competition. They have laid 1,949 eggs and rank third among all contestants.

NEW JERSEY flocks continued to lead all contestants in the Hunterdon County Egg-Laying Contest at the end of the thirty-seventh week of competition.

White Leghorns owned by Fox and Son Poultry Farm at Little Falls holds the lead with 1,804 eggs. In second place is a flock of Rhode Island Reds from Kerr Chickeries, Frenchtown. These birds have laid 1,709 eggs. Third and fourth places are held by entries from North Carolina and Massachusetts respectively.

ALTHOUGH New Jersey breeders of White Leghorns made a clean sweep during the thirty-seventh week of the Passaic County Egg-Laying Contest by taking all of the five positions on the honor roll of high scorers, the first two positions in total production are held by out of state flocks.

A pen of Rhode Island Reds from the Scott Poultry Farm, Groton, Mass., the present leader in total production has passed the 2,000 egg mark. Another pen of Reds from Parmenter's Red Mount Farm, Franklin, Mass., has laid 1,938 eggs.

A New Jersey flock of White Leghorns owned by Fox and Son Poultry Farm ranks third in total production and is credited with a 1,919-egg score.

COUNTY Agent Gauntt presents some questions to Hunterdon county farmers to which we all might well give thought and consideration. Upon the answers to these questions he hopes to build the outline for the extension program in Hunterdon county.

He states that the probable cause of farm dissatisfaction is an insufficient income to maintain a satisfactory standard of living. He asks the following questions: What is an adequate standard of living for the farm family of the county? What are the requirements for food, clothing, housing, education, recreation and health, and what will these items cost? What are the more profitable farm enterprises of the county? In what units are such enterprises most profitably operated? What combinations of enterprises and enterprise units have been found most advantageous in the local farm practice of the county? What volume of business is necessary to provide an income large enough to pay farm expenses and leave enough cash to provide an adequate living standard? How is the necessary volume of business to be developed? Should the farm be larger? Should certain enterprises be replaced by others that are more profitable? Should one enterprise be developed more rapidly than others, and if so, in what proportion?

Any farmer who can answer these questions and answer them correctly need no longer fear agricultural depressions and seek further "farm relief." But these questions do present the problems facing nearly every farm family in the country, and are worthy of much thought.

FARMERS in the vicinity of Salisbury, Maryland, are discussing the establishment of an auction block, for the sale of farm products, in that city during the coming summer.

THE ROUTE OF THE PENNSYLVANIA FARMER SPECIAL

WHEN I first sold Woodbine Farm I thought I would sell the other two farms, but after a more careful consideration I decided I would hold them. As long as I am physically and mentally able I want to be kept busy. I do not mean at manual labor, but I do want to have the management of a farm or farms.

One farm of 77 acres is only ten minutes from home. This is stocked with sheep and cattle and when at home I drive to it almost every day. We bring good rich milk from this farm every other day and having an electric refrigerator we can keep it for a week and it does not sour. By the way, I have never spent money for anything that brought us more comfort than the money for this machine.

This farm is a bluegrass farm and it will be our pleasure to make it more productive as the years go by. A neighbor, Mr. Lee Anderson, looks after the stock on this farm and it is a real pleasure to cooperate with him.

The other farm was bought in 1892, containing 450 acres, and is 20 miles from home. When this farm was first bought it took almost a day to go there on horse-back and bring them back at night. This is also a bluegrass farm, but some hay is harvested with which to winter our sheep. No cattle are wintered on this farm and since we make but little hay we buy our cattle in the spring and sell them in the fall.

For 18 years the late G. C. Knavenshute worked for me on Woodbine Farm and on a farm away from my home farm. He was one of the best hired men I ever knew. He died on my farm in early life. He left one son, W. Kent Knavenshute, who for ten years has been the manager of this 420-acre farm. He is like his father, honest, upright and industrious. As long as I own this farm I hope he will be the manager. He owns an adjoining farm but can look after both.

I am glad that it is almost impossible to make a profit from land without the close personal supervision of its owner or operator. If this were not true powerful money syndicates would buy and operate in large tracts. Individual ownership of land would not decline and such a condition of affairs would not tend toward community betterment. Denmark and other countries of Europe are prosperous and their citizens are happy because the farmers own small farms and are able to till them well.

With the conclusion of this chapter this auto-

Story of Woodbine Farm

By W. D. ZINN

(Continued from last week.)

biographical sketch will have ended. Many of my readers have written me that they have greatly enjoyed this story. Since for thirty years I have been doing my best to answer questions pertaining to the growing of crops, the management of livestock and the use of lime and commercial fertilizers my succeeding articles will be given over to a discussion of what we hope our readers will find to be a practical exposition of these subjects. Many readers will not be interested at all in this added discourse and to such we bid a kind farewell. To all those who are desirous of reading further we wish to say that no pains will be spared in our efforts to be helpful. We shall state the facts clearly and accurately as we have observed them and shall offer such suggestions as we have found to be of value on our own farm. I want at once to disclaim any profound technical knowledge of why things come about in this or that way. I know only that certain reliable procedures are followed by fairly definite results. My laboratory (if it may be classed as such) has been the field, the farm yard and the feeding pen. My textbooks have been the soil, the growing crops and the growing animal. And lastly my teacher, though severe at times, nevertheless I can rightly claim as one of the greatest—my teacher has been Experience.

Most Interesting Farm

ONE of the oldest and most interesting farms in the eastern part of our country was discovered on June 7th. These surprisingly agreeable facts, together with invaluable local historical records came to light when the well-known Frank L. Heilmann farm of Cleona, Lebanon county, Pennsylvania, was dedicated by Pomona Grange, the home organization of Patrons of Husbandry. This body has annual dedications. The farm lies at Hill Church, just north of Cleona.

Briefly, these are the facts which are so noteworthy and outstanding. In 1732, John Peter Heilmann, emigrated to America at the age of twenty. He bought and moved on 300 acres in the region now called Hill Church. Since that historic year, Georgia was settled at the same time, 1732-1798 years ago, six generations of Heilmanns have lived

on the farm. However, part of the land was sold off during the two centuries it was in their possession. Russell, the owner's son, manages the farm and represents the seventh generation, and his two sons, Russell and David, the eighth. Can you believe it? All were present at the dedication.

The Heilmann farm was christened "Heilbrunn Farm," after the ancestral village of the Heilmanns' near Wartburg, Germany. "Heilbrunn" means "health spring." Frank L. Heilmann & Son specialize in cattle breeding. John Peter Heilmann, the bold young pioneer, was the leader in erecting the Hill Lutheran Church. He, too, strated the cemetery at this church wherein lie his remains. Robert L. Weigelt

Smut Takes Heavy Toll

ONE out of every ten carloads of wheat received at the Philadelphia and Baltimore terminals from Pennsylvania points during the past six weeks has been reduced in grade and from five to fifteen cents a bushel in value because of smut. These shipments originated in the important wheat growing counties of the southeastern portion of the state, particularly Chester, Delaware, Franklin, Lancaster, Lebanon and York.

Such records indicate the great economic loss which farmers have suffered because of smut, the carlot shipments to the terminal elevators representative of the wheat crop throughout the state, it means that approximately 10,000,000 bushels of smutty wheat have been grown in Pennsylvania during the past five years which, at an average reduction of ten cents a bushel, would mean a loss of approximately \$1,000,000.

The number of carloads of wheat received at the above terminals and the percentage of these carloads which were reduced in value because of smut are as follows:

| Year | Total Carloads | Percentage Smutty |
|------|----------------|-------------------|
| 1924 | 488 | 10.1 |
| 1925 | 510 | 12.4 |
| 1926 | 1,205 | 7.1 |
| 1927 | 992 | 15.1 |
| 1928 | 328 | 12.4 |
| 1929 | 717 | 8.1 |

The small percentage of smutty wheat received from the 1929 crop is particularly encouraging. This reduction is undoubtedly the result of the excellent effort being made throughout the wheat growing sections to control smut by seed treatment. Due to seasonal factors, the amount of smutty wheat has fluctuated greatly from year to year, reaching a peak of 16.4 per cent in 1927. Since 1927, however, the trend has been steadily downward.

Milly Woodbridge's Trek to the Pacific

The Pioneers of the Peace River Valley

By C. A. Stephens

Copyright, 1930, by Capper-Harman-Steele, Inc.

THERE were marks of a collar on his neck, worn not long previously; and Woodbridge, senior, came to surmise that it was a dog collar from his owner by Indians whom he had decorated on account of ill treatment.

They had plenty of food such as it was, namely, berries, wild meats, milk and a small supply of sugar. There was no bread; and their store of tea and sugar was scanty. On the whole, however, they lived there much more comfortably than one would at first have believed possible. Milly's instincts as a housekeeper kept the little cabin in good order.

Weeks now passed with little in the way of incident, at least nothing exciting, indoors or outside. They were near losing the count of days at times and had long bouts of reckoning up from past dates that were remembered. Occasional snowfalls added to the depth that lay on the ground and correspondingly increased the labor of clearing it off the flats where the Jersey grazed for their daily supply of dry grass. Pinky had fabricated a pair of snowshoes for herself and at length another pair for Winthrop, using for the strips from a kind of tough osier, growing near the waterfall, and for the webs thongs of green elk-hide. They were fairly good shoes; and the bright winter day Winthrop made a trip on his skis to the lake shore for eight or ten miles, to see how far the lake extended to the northward and to ascertain if the outlet left the lake at that point. He satisfied himself that it did, and now they were pretty sure that this lake and stream were the headwaters of the Babine River, a tributary of the Skeena, which enters the Pacific at Prince Rupert. Already they were planning to make an early start when spring opened, and had good hopes of reaching the coast by June. Milly had been pleased for several weeks that her father was steadily improving; he seemed stronger and in better spirits. On pleasant days he walked out along the right-of-way path to the pool below the falls, and drew sticks off in the snow for Mike to retrieve. He went on gaining, they felt sure he would be able to move forward with them by April.

Hopes at once futile and pitiable. Less than a week later the most disheartening blow of all fell on that lonely cabin in the wilderness. Quite suddenly the elder Woodbridge suffered from a hemorrhage so severe and so protracted that he never quite rallied and passed away during the following night.

The subject was so manifestly painful to Milly and Winthrop that I refrained from asking them to tell the particulars. It was evident to me that they blamed themselves excessively for urging their father to undertake the journey. Milly especially. They thought, or at least they feared, that the long journey had caused his death. However, it is quite clear that he was dangerously ill from tuberculosis of the lungs before he started, and it is likely that his malady would have gone on to fatal termination even if he had never left Woodbridge Creek.

LIFE has many painful situations, but probably none more so than the death of a near and dear relative in a remote wilderness where no assistance can be obtained from the outside world to mitigate the melancholy labors of burial. Winthrop and Milly helped somewhat by the squaw, were obliged to dig their father's grave with their own hands, and bury him with none of the usual rites and services that help ameliorate death in Christian lands. It must have been an unspeakably sad experience for them, blaming themselves as they did, for perhaps imagine the stern outward features of the case; the intense cold of January, the deep snow and the hard frozen earth; but the grief and despair of the two youthful mourners would be impossible to depict.

They made the grave just across the frozen pool from the waterfall, at the foot of a large cottonwood, and lined the pit lovingly with green boughs. As all they could do in token of filial affection, they smoothed a fresh spot on the tree and cut the initials, F. W., with the date. That the funeral pyre was laid to his eternal rest, peacefully, it may be, by the ceaseless murmur of the falling waters. Success in life had not been his. He had wandered long and bravely laid down the burden of existence in a far-off, savage wilderness.

It appeared that he had not fully recovered consciousness after the last hemorrhage, not sufficiently to converse or express even a last wish; but after his death they found a little sealed envelope in his pocket-book, containing a lock of his hair, a little "tintype" picture and two double eagles in gold, all carefully folded in half a

sheet of note paper on which he had written the words, "Poor Ruth's hair. She always kept these gold pieces in case of some emergency when we had nothing else to help ourselves with."

The "poor Ruth" thus pathetically mentioned was Milly's and Winthrop's mother whom the little picture showed as a young woman of about thirty.

I was not surprised to learn that the gloom of their father's death rested so heavily on them that for a number of weeks they quite lost interest in the future, nor cared greatly whether they went on from there or not. Fits of remorse for having started fell upon them at times, on Milly in particular.

But youth is naturally buoyant, and properly so. As March approached and certain evidences of approaching spring appeared, the hope and desire of reaching Prince Rupert revived. About the 20th of the month a warm wind began blowing from the West, and during the night the temperature rose so rapidly that more than half the snow melted before ten o'clock the following forenoon. Water stood on the ice of the lake and the little river near their cabin rose in flood, plunging over the cliff into the pool in a roaring, yellow torrent. Such winds from the coast are locally known as "Chinooks;" they are supposed to have some connection with the Kuro-Siwo, or Black Stream; the warm oceanic current that flows across the Pacific from the vicinity of Japan and causes a marked amelioration of the climate all along the west coast of British Columbia and Alaska.

But cold blasts from the north immediately followed this genial breath of the Pacific. Zero weather prevailed again; the water on the lake froze solidly, as did the snow ashore. They had now a two hours' task with ax and shovel to uncover enough sodden grass to appease Brighteyes' hunger. The poor young Jersey was growing thin from lack of proper fodder, but would still caper a bit when let loose from her shed.

The Cheerful Plowman

DESTROYED CONFIDENCE

I'M sorry, Martin Baker, a man I thought as fair, showed up a sort of fakir and not exactly square! You see I sold him carrots some two full years ago and took in trade some parrots and one loud speaking crow! But listen, that dear sinner came back to me and said, "Those carrot paws were thinner than many in my shed, so did we not mis-figure and were you not all off? You thought the weight was lighter," and here he stopped to cough! "I did not weigh them, Baker, I measured them in rough; I'm sorry as a Quaker I did not give enough, but here's two pails, saints bless you, so add these to the rest, take them, don't make me press you! I'm sorry!" I confessed.

He took those extra carrots and went his weary way, while I retained my parrots and petted them all day. But sad am I in telling and sad am I to know that when I thought of selling the parrots and the crow, a parrot-crow physician, a man who knew his birds, said, "Ah, a bum condition!" I trembled at his words. "Your parrots have the glanders and fallen arches, too! They're worth no more than gardeners, they are not worth a soul! And that squaw-crow, sir, has three known kinds of pin, three shoe-balls in a row, sir, and cankers on his lip! Somebody must have read, sir, your bland and trusting face; the fools are not all dead, sir, they still infest the race!"

Well, well, all words are sickly, they can't tell how I felt; my confidence so quickly was struck below the belt! But now, that fellow, Baker, has come to buy some meal; he wants it, gentle fakir, to make his pocket square! And here I go to weigh it, to place it on the scales! Ah, how I hate to say it! I can't forget those pails, those pails of stolen carrots that I was cheated on, also the crow and parrots! My confidence is gone!

J. E. T.

A day or two later Milly and Winthrop set off on the ice with Mike to go down to the foot of the lake again, in order to make sure that the outlet was actually at the north end of it. On his previous trip there, Winthrop had felt pretty certain this was the case; but they wished to be sure, since if the outlet were there, they had no doubt that it was the Babine River and that the best route to Prince Rupert lay in that direction. If not, they knew not what lake they were on, or into what strange wilderness their wanderings had led them. It was fine walking on the ice. If they had had skates, they could have skated for much of the way. On approaching the north end of the lake, they now easily found where a large stream of water left it. Previously there had been ice on the outlet, covered by snow, but now there was a patch of open water where a swift current ran out over shallows. The gap in the wooded hills, too, where the stream made off to westward, was quite apparent.

"This is Babine River all right!" Winthrop exclaimed confidently. "It accords with the maps." "And this we are on Babine Lake," Milly said. "The lake where father died," she added pensively. "We must remember the place. Some time we will come back to mark his grave."

On their return they crossed to the west shore of the lake to examine a remarkably white rock they had often noticed over there from their cabin on the other shore. It was of singular contour and appeared to be pure white feldspar. From that side of the lake there was a grand view across it to the southeast. Far in the distance were several lofty white peaks, which I think likely were Mt. Robson and others at what is now Jasper Park. One of them may have been Mt. Edith Cavell, recently named in honor of the heroic English nurse whom the Germans executed during the World War. The sun had already set behind the shore hills on that side, but its light still shone on the distant white range of the central Rockies.

As they stood looking off, Mike suddenly growled warningly and glancing along the shore, they saw that two wolves had come out on the ice and with heads askance were silently watching them. Not expecting to see game on the frozen lake, Winthrop had not taken the gun. There was little danger of two wolves attacking human beings by daylight; but as there might be others not far off and night was at hand, they judged it prudent to be on their way home to the shelter of their cabin. Mike, too, was evidently of the same mind; he came on behind, growling under his breath, having clearly the worst possible opinion of his lupine cousins.

As they crossed the lake, a distance of from two to three miles, the wolves followed, not directly, but taking a parallel course, keeping a quarter of a mile or more away. They appeared to be scouts, out looking for quarry of some kind. Coming at length where they saw or scented the smoke of the fire, the squaw was keeping in the cabin fireplace, they stopped and after standing still for some time returned rapidly to the woods on the far side of the lake. At no time were they fairly within gunshot; and, indeed, if Winthrop had had his gun, the wolves would not have followed them at all, perhaps would not have issued in sight from the woods. The gray wolf of these wilds is now an exceedingly cunning brute. They know all about guns and generally, when they see that a man is armed with one, will not risk a shot by showing themselves. Winthrop thought it was curiosity about white Mike that had led these wolves to come out on the ice and follow them. Mike himself appeared to think so!

Ever after the Chinook came, the dry grass under the snow had been sodden and bad on account of water that had filtered down to it. Brighteyes no longer found it appetizing food. They discovered that she preferred the little twigs from the tops of the cottonwood trees, numbers of which Winthrop had felled at the time they built their log-house. After drinking mornings, at the hole through the ice on the pool, which Winthrop kept open for her, she went off browsing trigs instead of returning to the plat of dead grass they had uncovered for her. On this hint they now began driving her up to the back of the shore crags, where there were fresh corpses of young cherry, birch and saskatoon. These green shoots Brighteyes seemed to like very much. It was crude fodder; but in the Northwest, when hay fails, farmers sometimes subsidize their young animals on such "browse" for weeks at a stretch.

(To be continued.)

The Farm Home

Let's Not Worry about Clothes for the Trip

Editor's note:—One of the girls of the Pennsylvania Farmer staff recently wrote a little story to try to convince one of her relatives to join the Pennsylvania Farmer Pacific Northwest Tour. It contains so many suggestions for any woman who travels that it is being printed below in part.

MARTHA ADAMS was in tears. Was there no end to the dishes? That's the trouble when all your girls are boys. When did she ever get away for a vacation? Dad and the boys had enjoyed their week of hunting the last ten years. When the last towel was rinsed and hung on the back porch to dry, Martha dropped into the low kitchen rocker and picked up the latest issue of Pennsylvania Farmer with its descriptions of a western tour.

Glacier National Park—pine forests and rocky canyons! Beautiful Columbia River drive; Seattle and a boat ride through the largest locks in the world. A day on an ocean liner—Martha had always wanted to see the Pacific. Hotels—meals on the train; three days in Yellowstone Park—see Old Faithful—the bears—

Footsteps outside startled Martha. Tired eyes lighted as she greeted her nearest neighbor and old friend, Mary Barlow.

"Martha," said Mary, without more than a swift "Hello, there!" "How would you like to take a trip out West with me this summer?"

"Why, Mary, that's just what I've been reading about in the Farmer."

"Of course," replied Mary. "I had forgotten you were a subscriber, too. You've never had a trip; why not go with me?"

"But, Mary, I haven't the clothes for a trip like that. I could never buy all the dresses and hats I needed and have enough left for the trip. Besides, all those people will be city folks and wouldn't have time for a backwoods farmer's wife."

"Now, that's just where you're mistaken, Martha. If you go you'll find nearly all the crowd just common folks like ourselves. And as for your clothes, don't even think about getting anything new. Come on now, let's just sit down here and plan your packing. Suppose we pretend you are going."

A skeptical smile appeared on Martha's face. Nevertheless she settled back in her rocker and gave full attention to her friend.

"We'll start with your dresses since that is the biggest item. There's that dark blue coat and dress you got last spring. Just the thing to travel in. Easy to slip on and off and won't show the dust. Then you have that black and white cotton dress. It won't wrinkle with packing. That's two—now, just one more. One dress on your back and two in your bag are plenty."

"Gracious," gasped Martha. "I can't go on a trip like that with only those old duds."

"Yes, you can," Mary replied. "Don't make the mistake I did on my first trip when I nearly bent double under two suitcases and a traveling bag. I took a different dress for each day. You don't want an extra thing—just the bare necessities."

"Well, then, how about that light tan I got at the sale last month?" suggested Martha.

"No, that won't do at all. You'd be worried to death all the time for fear you got a spot on it. Besides that pleated skirt would be in a fine mess after a day in the suitcase. The old black you've been wearing the last two years will be just right."

"Well," sighed Martha, "it does seem—"

There's a First Time for Everyone

But Mary interrupted, "Now for the undies. Go as far as you like there. Perhaps you will have a chance to send clothes to the laundry and pick them up later but don't count on it. Take five or six complete changes of underwear—some material that won't take up too much space. You must have at least five pairs of stockings. But only the dark shades. I'm sure there will be a chance to rinse them out and hang them to dry in the wash-

room; but take plenty and you won't have to worry. In the Pullman, you know—"

"There," interrupted Martha, "that's another thing—the Pullman. You know I never traveled much. I'd just be the laughing stock of the whole train."

"Fiddlesticks, Martha, probably half the crowd will be in the same boat. But let's get back to the clothes and we'll discuss the train later."

"Dresses, undies, stockings," she enumerated. "What else? Yes, an extra slip. You'll be wearing a dark blue one and should take an extra one."

Now then, over in this corner we'll pack three nighties and keep one out for your handbag. That, with your kimono, will be packed ready for the first night on the train. Slip in your bedroom slippers in the handbag and you'll be ready to pick it up and leave the train for those three days in Yellowstone. When we're away from the train we'll just take our small bags.

"Put some of your handkerchiefs in the suitcase and some in the small one. Take one other pair of comfortable low-heeled shoes to change off. Your toothbrush and little sewing kit won't take up much room in the small bag; along with your comb and any other little toilet things you want. Now everything is packed and you don't have to call in the men folks to sit on the lid to fasten it either."

"As for a coat—wear your medium heavy tweed. Of course it is shabby," reading, the look on Martha's face, "but it is heavy enough to feel good in the higher altitudes we shall visit and you won't have to be fussing all the time about having it put on a hanger. You just can't muss a coat like that. I think we had better take that light sweater, too."

"Hat? Yes, better slip in an old dark felt and wear your blue close-fitting one—the one with a little brim. It will be a great protection for the eyes during the auto and boat trips."

"Now, then, there's the suitcase and bag all packed. After we get to the train you can forget all about it for the porter will immediately take it to your section."

The Porter Won't Expect a Tip

"There's another thing," wailed Martha. "I've heard those porters always expect a dime or quarter or something every time they look at you. Like as not I'd give him too much and he'd know I was a greenhorn, or I'd not give him enough and he wouldn't do a thing for me all the way."

"Now there's just where you're mistaken, Martha. You don't have to worry about tips or meals or anything on this trip. Doesn't the Farmer say that after you pay your final deposit you can leave your pocketbook at home?"

"So it does." And Martha drew a sigh of relief. "I'd forgotten. Now do tell me more about the train for I don't know the least thing about how they make up the beds or what they do with them in the daytime."

"There isn't much to learn. After the first night you will feel like an old experienced traveler. Just keep your eye on some of the others. You and I will have a section—two seats facing each other. They are very comfortable with nice fresh covers every day, or twice a day if you like. At night the porter changes these into two beds—one above the other. They are called upper and lower berths. There is room for four people in a section in the day time, but we shall have one all to ourselves."

"At one end of the car is a washroom for women, at the other end one for men. They have several mirrors, four or five wash basins, dental lavatory, hot and cold water, liquid soap and all the fresh, clean towels you can use."

"How in the world do you climb into the upper berth?"

"The porter brings a short ladder, places it against the berth and up you go. It's almost as easy as walking upstairs. Both berths have mattresses with horsehair pads. Each bed has one or

two blankets and three sheets which completely cover them. There is a complete change every day so you don't need to be afraid of using someone else's. There are two pillows for each berth. There is an electric reading light and hangers for clothes."

"The berths are enclosed with heavy curtains, set for both upper and lower so that they are almost as private as individual rooms. Any time during the day or night just push the electric button."

(Continued on page 19.)

Hints on Pie Making

THERE are only two kinds of pies my husband will eat—hot and cold. Here is a good recipe for pie crust:

Three cups sifted flour, one cup of shortening, one teaspoon salt, cold water to make stiff dough. Add salt to flour before sifting. Add shortening. Use wire potato masher to cut and mix the shortening with the flour. It saves time. Add water little at a time, until dough leaves side of mixing bowl clean. This makes three medium-sized two crust pies.

If your family is small and you need only one pie at a time, try slightly greasing the remaining dough, wrap in wax paper, keep in refrigerator till wanted.

For one crust pies, place dough on inverted pans, prick with fork to prevent air bubbles forming. When crusts are cool, remove from pans, place together, keep in refrigerator. Reheating freshens them.

To prevent sugar from caking under top crust in fruit pies, mix sugar thoroughly with the fruit and the fruit.

Does the juice run out? There are several ways to remedy this. About three tablespoons of flour or cornstarch mixed with the sugar will thicken the juice enough to keep from running. Dampen the edge of lower crust with cold water, before placing on top crust. This prevents crusts from separating. A short piece of macaroni or a piece of paper rolled in a cone shape with small end inserted in slit of top crust will keep juice from running on top of pie.

Are your custard pies soggy? Try baking top crust until the form is barely set before adding filling. Too much sugar in the meringue will cause it to be watery. One tablespoon to each egg white is sufficient. Individual pies made in muffin pans are fine for children's lunch or picnics.

Any leftover dough can be made into jelly rolls which always delight the children. Roll dough thin. Cut out with biscuit cutter. Use narrow strip of dough to form raised ring in center. Bake. When cool, add a bit of bright colored jelly to center of ring.

A Trick in Cooking Steak

INSTEAD of pounding the flour into the steak, try kneading it in, just as if you were kneading it into bread dough. You will find it easier, and quickly done, and the steak will be more juicy when the fibers are completely crushed. A piece of steak can be made to take up nearly a cup of flour. Then fry brown in the usual way or broil into the oven and roast.

Cheese Souffle

Melt two tablespoons butter in sauce pan. Add three tablespoons flour, one-half teaspoon salt, one-eighth teaspoon pepper, one-eighth teaspoon ground mustard, and a few grains of cayenne. Beat to a smooth paste, add one-half cup scalded milk, stirring constantly and one-fourth cup grated cheese. When cheese is melted remove from heat, add the yolks of three eggs and beat three minutes. Fold in the beaten whites of the eggs. Bake in well buttered pan for twenty minutes. Serve at once.

Cheese Knights

Cut stale bread in rounds one-half inch thick. Bring one cup milk to boiling point, add four tablespoons sugar. While boiling pour it over one beaten egg. Dip the rounds of bread in this mixture, dust with snappy cheese grated fine, dip in fine bread crumbs and fry in smoking hot fat. Drain on a low dish with stewed apples, arrange the rounds over them and serve.

L. M. Thornton

Wake-up FOOD— mighty refreshing these warm days!

POST TOASTIES—that's the food to energize you these balmy days of summer. Crisp, toasted flakes of sun-ripe corn—easy to digest, quick to release their refreshing store of energy to the body. Post Toasties is the wake-up food. Send it afloat in cool milk or cream. What a brisk breakfast! How fresh and vigorous for lunch! A wonderful supper "pick-up"! Little folks ask for more and more. Big folks, too. You'll say this brisk wake-up food is delicious—delicious.

Footsteps outside startled Martha. Tired eyes lighted as she greeted her nearest neighbor and old friend, Mary Barlow.

"Martha," said Mary, without more than a swift "Hello, there!" "How would you like to take a trip out West with me this summer?"

"Why, Mary, that's just what I've been reading about in the Farmer."

"Of course," replied Mary. "I had forgotten you were a subscriber, too. You've never had a trip; why not go with me?"

"But, Mary, I haven't the clothes for a trip like that. I could never buy all the dresses and hats I needed and have enough left for the trip. Besides, all those people will be city folks and wouldn't have time for a backwoods farmer's wife."

"Now, that's just where you're mistaken, Martha. If you go you'll find nearly all the crowd just common folks like ourselves. And as for your clothes, don't even think about getting anything new. Come on now, let's just sit down here and plan your packing. Suppose we pretend you are going."

A skeptical smile appeared on Martha's face. Nevertheless she settled back in her rocker and gave full attention to her friend.

"We'll start with your dresses since that is the biggest item. There's that dark blue coat and dress you got last spring. Just the thing to travel in. Easy to slip on and off and won't show the dust. Then you have that black and white cotton dress. It won't wrinkle with packing. That's two—now, just one more. One dress on your back and two in your bag are plenty."

"Gracious," gasped Martha. "I can't go on a trip like that with only those old duds."

"Yes, you can," Mary replied. "Don't make the mistake I did on my first trip when I nearly bent double under two suitcases and a traveling bag. I took a different dress for each day. You don't want an extra thing—just the bare necessities."

"Well, then, how about that light tan I got at the sale last month?" suggested Martha.

"No, that won't do at all. You'd be worried to death all the time for fear you got a spot on it. Besides that pleated skirt would be in a fine mess after a day in the suitcase. The old black you've been wearing the last two years will be just right."

"Well," sighed Martha, "it does seem—"

There's a First Time for Everyone

But Mary interrupted, "Now for the undies. Go as far as you like there. Perhaps you will have a chance to send clothes to the laundry and pick them up later but don't count on it. Take five or six complete changes of underwear—some material that won't take up too much space. You must have at least five pairs of stockings. But only the dark shades. I'm sure there will be a chance to rinse them out and hang them to dry in the wash-

room; but take plenty and you won't have to worry. In the Pullman, you know—"

"There," interrupted Martha, "that's another thing—the Pullman. You know I never traveled much. I'd just be the laughing stock of the whole train."

"Fiddiesticks, Martha, probably half the crowd will be in the same boat. But let's get back to the clothes and we'll discuss the train later."

"Dresses, undies, stockings," she enumerated. "What else? Yes, an extra slip. You'll be wearing a dark blue one and should take an extra one. Now then, over in this corner we'll pack three nighties and keep one out for your handbag. That, with your kimono, will be packed ready for the first night on the train. Slip in your bedroom slippers in the handbag and you'll be ready to pick it up and leave the train for those three days in Yellowstone. When we're away from the train we'll just take our small bags."

"Put some of your handkerchiefs in the suitcase and some in the small one. Take one other pair of comfortable low-heeled shoes to change off. Your toothbrush and little sewing kit won't take up much room in the small bag; along with your comb and any other little toilet things you want. Now everything is packed and you don't have to call in the men folks to sit on the lid to fasten it either."

"As for a coat—wear your medium heavy tweed. Of course it is shabby," reading, the look on Martha's face, "but it is heavy enough to feel good in the higher altitudes we shall visit and you won't have to be fussing all the time about having it put on a hanger. You just can't muss a coat like that. I think we had better take that light sweater, too."

"Hat? Yes, better slip in an old dark felt and wear your blue close-fitting one—the one with a little brim. It will be a great protection for the eyes during the auto and boat trips."

"Now, then, there's the suitcase and bag all packed. After we get to the train you can forget all about it for the porter will immediately take it to your section."

The Porter Won't Expect a Tip

"There's another thing," wailed Martha. "I've heard those porters always expect a dime or quarter or something every time they look at you. Like as not I'd give him too much and he'd know I was a greenhorn, or I'd not give him enough and he wouldn't do a thing for me all the way."

"Now there's just where you're mistaken, Martha. You don't have to worry about tips or meals or anything on this trip. Doesn't the Farmer say that after you pay your final deposit you can leave your pocketbook at home?"

"So it does." And Martha drew a sigh of relief. "I'd forgotten. Now do tell me more about the train for I don't know the least thing about how they make up the beds or what they do with them in the daytime."

"There isn't much to learn. After the first night you will feel like an old experienced traveler. Just keep your eye on some of the others. You and I will have a section—two seats facing each other. They are very comfortable with nice fresh covers every day, or twice a day if you like. At night the porter changes these into two beds—one above the other. They are called upper and lower berths. There is room for four people in a section in the day time, but we shall have one all to ourselves."

"At one end of the car is a washroom for women, at the other end one for men. They have several mirrors, four or five wash basins, dental lavatory, hot and cold water, liquid soap and all the fresh, clean towels you can use."

"How in the world do you climb into the upper berth?"

"The porter brings a short ladder, places it against the berth and up you go. It's almost as easy as walking upstairs. Both berths have mattresses with horsehair pads. Each bed has one or

two blankets and three sheets which completely cover them. There is a complete change every day so you don't need to be afraid of using some one else's. There are two pillows for each berth. There is an electric reading light and hangers for clothes."

"The berths are enclosed with heavy curtains, set for both upper and lower so that they are as most as private as individual rooms. Any time during the day or night just push the electric button."

(Continued on page 19.)

Hints on Pie Making

THERE are only two kinds of pies my husband will eat—hot and cold. Here is a good recipe for pie crust:

Three cups sifted flour, one cup of shortening, one teaspoon salt, cold water to make stiff dough. Add salt to flour before sifting. Add shortening. Use wire potato masher to cut and mix the shortening with the flour. It saves time. Add water little at a time, until dough leaves side of mixing bowl clean. This makes three medium-sized pie crusts.

If your family is small and you need only one pie at a time, try slightly greasing the remaining dough, wrap in wax paper, keep in refrigerator till wanted.

For one crust pies, place dough on inverted pans, prick with fork to prevent air bubbles forming. When crusts are cool, remove from pans, press together, keep in refrigerator. Reheating from cold.

To prevent sugar from caking under top crust in fruit pies, mix sugar thoroughly with the fruit and the fruit.

Does the juice run out? There are several ways to remedy this. About three tablespoons of flour or cornstarch mixed with the sugar will thicken the juice enough to keep from running. Damp the edge of lower crust with cold water, before placing on top crust. This prevents crusts from separating. A short piece of macaroni or a piece of paper rolled in a cone shape with small end inserted in slit of top crust will keep juice from running on top of pie.

Are your custard pies soggy? Try baking the crust until the form is barely set before adding filling. Too much sugar in the meringue will cause it to be watery. One tablespoon to each egg white is sufficient. Individual pies made in muffin pans are fine for children's lunch or picnics.

Any leftover dough can be made into jelly roll which always delight the children. Roll dough thin. Cut out with biscuit cutter. Use narrow strip of dough to form raised ring in center. Bake. When cool, add a bit of bright colored jelly to center of ring.

A Trick in Cooking Steak

INSTEAD of pounding the flour into the steak, try kneading it in, just as if you were kneading it into bread dough. You will find it easier, and quickly done, and the steak will be more juicy when the fibers are completely crushed. A piece of steak can be made to take up nearly a cup of flour. Then fry brown in the usual way or broil into the oven and roast.

Cheese Souffle

Melt two tablespoons butter in sauce pan. Add three tablespoons flour, one-half teaspoon salt, one-eighth teaspoon pepper, one-eighth teaspoon ground mustard, and a few grains of cayenne. Stir to a smooth paste, add one-half cup scalded milk, stirring constantly and one-fourth cup grated cheese. When cheese is melted remove from fire, add the yolks of three eggs and beat three minutes. Fold in the beaten whites of the eggs and bake in well buttered pan for twenty minutes. Serve at once.

Cheese Knights

Cut stale bread in rounds one-half inch thick. Bring one cup milk to boiling point, add four tablespoons sugar. While boiling pour it over one well beaten egg. Dip the rounds of bread in this mixture, dust with snappy cheese grated fine, dip in fine bread crumbs and fry in smoking hot fat. Drain on a low dish with stewed apples, arrange the rounds over them and serve.

Wake-up FOOD—

mighty refreshing these warm days!

POST TOASTIES—that's the food to energize you these balmy days of summer. Crisp, toasted flakes of sun-ripe corn—easy to digest, quick to release their refreshing store of energy to the body. Post Toasties is the wake-up food. Send it afloat in cool milk or cream. What a brisk breakfast! How fresh and vigorous for lunch! A wonderful supper "pick-up"! Little folks ask for more and more. Big folks, too. You'll say this brisk wake-up food is delicious—delicious.

POST TOASTIES

The Wake-up Food

A PRODUCT OF GENERAL FOODS CORPORATION

*A safer, more comfortable
car to drive, an economical car to own*

PONTIAC BIG SIX

Product of General Motors

The 4-Door Sedan, Body by Fisher

For the modern farm family, in which a car often serves many masters, the New Series Pontiac Big Six is especially practical. Its sturdy durability is splendidly equal to the strain of steady employment. And mother or sister can drive it with as much safety and comfort as any masculine member of the household.

It has big, powerful brakes which answer the easiest pedal pressure and bring the car to a quick, smooth stop. It has a new roller bearing steering system to provide that added facility of handling so convenient when driving in traffic and parking. A gracefully sloping windshield gives maximum vision and deflects headlight glare. Fully adjustable front seats and deeply upholstered, form-fitting cushions are also important factors of its comfort. There are rubber cups on clutch and brake pedals to keep out dust and draughts, and improved Lovejoy Hydraulic Shock Absorbers to afford increased riding ease.

Write for an interesting booklet which illustrates and describes the design of the New Series Pontiac Big Six with its important improvements.

Such features mean more than ever when you consider the economy of the New Series Pontiac Big Six. Its big 60-horsepower engine—the largest in any six of its price—provides great power, speed and acceleration with low fuel consumption. Its moderate speed engine reduces friction and wear of moving parts to a minimum with the result that maintenance cost is lowered and longer life assured.

Call at an Oakland-Pontiac salesroom and talk with the dealer about this car. Let him show you its new bodies by Fisher. Examine the genuine mohair of their trimly tailored interiors. Then try Pontiac in a good stiff road test. It will be easy to decide in Pontiac's favor when you see it perform and know the fine all-round value of this low priced six. Seven body types. All prices f.o.b. Pontiac, Michigan, plus delivery charges. Oakland Motor Car Co.

Remember... you can buy a Pontiac on special G. M. A. C. terms offered to farm buyers exclusively with payments at convenient intervals during the year.

\$745

A FAMOUS NAME • A FINER CAR AND UP, F. O. B. PONTIAC, MICHIGAN

An actual cash
saving of \$1.06
per day

That's what the McCanna
Farms test showed about

Mobiloil

Photo by Underwood & Underwood

Photo by Underwood & Underwood

"No, sir, she didn't heat up once. Been running steady all day, too. Well, that means lower oil costs, because this Mobiloil lasts longer in the crank-case."

\$1.06 actual cash savings per day through the use of Mobiloil. But wait a moment before we go ahead with the story of how this test worked out. Let's just figure out what it means to get a saving of \$1.06 per day.

We'll say, for example, that you've got a patch of ground that you're going to list into corn. And, barring any trouble with the lister or tractor, you figure it will take about two weeks to get it all in. That makes about twelve working days. If you can actually save \$1.06 every day, well, you would save \$12.72 on that one job alone.

Now let's go a little farther. You have plenty of other jobs for your tractor, too. Figure up a couple of weeks for disking, and some more time for the wheat binder and the thrasher. By the time you figure it up for a year it begins to run into real money. You could almost save enough to pay for the spring seed or buy the winter feed for fattening that bunch of porkers.

It certainly will pay you to look into these savings made possible by the use of Mobiloil. But you've got to have proof that this can actually be done. Let's look over the test.

How the McCanna Farms
test worked out

Maybe you already know something about the

McCanna Farms. They're located near the town of McCanna up in North Dakota and consist of some 8000 acres of land.

Six well known tractors were used. They all did the same work in the same field, each breaking sandy clay and loam, with the same arrangement of gang plows. The idea was to find out which oil gave the biggest savings both in oil and fuel consumption. Running time and fuel and oil used were carefully checked by a tractor expert and the farm superintendent.

Here are the official results:

| COMPETITIVE OIL | MOBILLOIL |
|--|-------------|
| Oil used per 10-hr. day . . . 6.63 qts. | 3.07 qts. |
| Fuel used per 10-hr. day . . . 33.10 gals. | 28.20 gals. |

Mobiloil showed a saving of 53.7% in oil consumed and 14.8% in fuel used.

Comparative costs

| COMPETITIVE OIL | MOBILLOIL |
|---|-----------|
| Fuel (@ 14¢ per gal.) per 10-hr. day . \$4.63 | \$3.95 |
| Oil (competitive @ 72¢ per gal. Mobiloil @ \$1.05 per gal.) per 10-hr. day . . . 1.19 | .81 |
| Total cost of fuel and oil . . . 5.82 | 4.76 |

Total Saving with Mobiloil \$1.06

Now, when you consider your car and truck, it's just common sense to figure that when Mobiloil shows such remarkable results in a tractor test, it must be about the most economical lubricant you could use for any piece of machinery.

Why Mobiloil makes possible
these savings

In Mobiloil, ALL the essential properties of a full duty oil are present and in correct proportion for your tractor engine.

These properties are: (1) OILY CHARACTER—provides moving parts with rich lubrication—and holds down wear; (2) RESISTS HEAT—lasts longer—keeps down oil consumption, and makes for economical use; (3) CONTROLS CARBON—keeps hard carbon deposits from piling up in your cylinders; (4) OXIDATION CONTROL—keeps oil systems from clogging, and valves from sticking and gumming.

Next time you are in town, have your dealer consult the complete Mobiloil Chart, just to check up on the proper grades of Mobiloil to fit your own particular needs—for car, truck and tractor.

Also, have your dealer tell you about the economy and convenience of getting Mobiloil in 55-gallon or 30-gallon drums.

VACUUM OIL COMPANY

61 BROADWAY, NEW YORK CITY
Makers of high quality lubricants for all types of machinery

Getting your Mobiloil in a drum is mighty convenient. Ordinarily you won't have to worry about your oil supply for the rest of the season. You can set it up in the machine shed across a couple of wooden horses or benches where it's handy. A convenient faucet is attached, too.

Mobiloil

THE YOUNG PEOPLE

Let Me Live in the Country

By LUCY WITHEROW

Prize Story

VACATION has begun and we expect to have so much fun this summer that I am going to write a diary to keep track of it.

Park and I are eleven-year-old cousins living on a farm in Path Valley, a lovely place in the mountains of southern Pennsylvania. We are twelve miles from the Lincoln Highway, and just a little nearer Pittsburgh than to Philadelphia.

The day after school closed we fixed up a tadpole pond. When a neighbor drained his goldfish pond this spring we gathered up one hundred and seventy-five tadpoles. If you have never seen them develop into frogs you have missed something interesting. You should put one in a fish bowl and watch it. The arms and

legs grow on, the little button mouth grows wider and wider, the flat fish eyes change to pop-eyes, and the tail gets smaller and smaller until it is gone. Our tadpoles are growing, and we expect to have a fine frog chorus before long. We have a nice lot of big bull-frogs now, and I wish you could hear them sing. They can be picked up almost any time.

We have two young kittens and one day last week we christened them. The grown cats had never been christened either, so we decided to do them all at once. We got water from both springs and the creek and mixed it with rain water. My old pet cat, Body-By Fisher, disgraced himself. We had to throw the water after him, and name him on the run. Melting Sugar didn't do much better, but the kittens Orinoco Tapioca and Cypress

Frank Robert Woodruff is this young fellow's name. He was three years old in February. The pony colt is a month old.

Margaret Della Miller and her pig. His playmate is King, the dog.

Fireball, behaved beautifully, and I know their names will last throughout their nine lives. Now if only we can save them from the mange next winter we will have two fine cats. We had such bad luck last winter. Melting Sugar is the only one left of last year's crop and our cat cemetery is nearly full.

There is a place near here that Park and I call "The Limberlost" because it reminds us of the one in Gene Stratton Porter's story. We find the most interesting things there—moths, butterflies, cocoons, wild flowers, mushrooms, turtles, etc. We started a collection of moths last year and had a Royal Walnut, a Luna, a Sphinx and many other kinds. The only trouble is that we hate to kill them and nearly always decide to set them free.

When they clipped the sheep a few days ago we had Pal clipped too. Pal is a big yellow and white Collie that has been our playmate ever since he was a puppy, six years ago. We have all his fur clipped off except the puppy locks under his ears and his bushy tail which we leave on so that he will have a better fly-brush, and when he is finished he looks just like a fox. Every one laughs at him but we don't care—we want him to be comfortable.

Yesterday Pal brought in a groundhog that he had killed. We used artificial respiration to try to bring him back to life, but he had gone to the happy hunting grounds for woodchucks. We each gave Pal two smacks and a good scolding but it is pretty hard to teach him not to kill them when Uncle encourages it. If they all lived I suppose the fields would be so full of their runs that the horses would step in the holes and break their legs, but they are such pretty little animals that we'd like to save them.

One evening last week Uncle told us if we would be at the barn at six o'clock the next morning he would give us a present. We were very curious but could find out nothing except that the present was something living that could be divided. We were there bright and early next morning, and he

gave us each a two-months-old pig. They were pretty heavy but we carried the little squealers down to the pen, and are going to feed them well, and see how big we can make them grow until next fall, when we will sell them, and we are hoping for good pork prices. We call them William and Lillian.

We brought in some laurel and a mossassin flower from the woods yesterday to plant near the house, and a box turtle for our turtle collection. We have trailing arbutus, hepatica, colts foot, blood root and other wild flowers growing. We use the juice of the blood root for Indian war paint.

We find that the birds like weather-beaten boxes better than freshly-painted ones. Park made a number

of houses of discarded roofing paper which had been used a long time, and they are the birds' favorite boxes. He always tries to make them cat-proof by hanging them on wire. Our cats are good ones, but I wouldn't trust any cat with a nest of little birds.

I hope all of you can enjoy the country this summer. Maybe I'll like the city when I grow up, but just now I can't think of any thing better than to be eleven years old and to live in the country in June.

Editor's note.—Let's hear from some more readers about their summer vacations. Prizes for all letters printed.

Send your letter to Young People's Editor, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Little Folks' Corner

Clara Visits Grandmother

By AUNT BELLE

"MOTHER, may I wear my new dress?" asked Clara.

"Yes, dear, but be sure to take an old one to wear while you are helping Uncle to milk," answered her mother, with a wink at Grandmother, who sat looking on.

Clara was ten and she was going home with Grandmother for a week. Grandmother lived on a farm and Clara always had such glorious times while there. There were so many interesting things in the country, and besides they were going to drive Grandmother's nice old horse, and Clara liked that much better than riding in her daddy's car, for she could enjoy the beautiful country so much better. The car whizzed past things so fast one scarcely got a glimpse of them, and Clara wanted to watch the pretty little brook as it gurgled along, while Grandmother allowed old Ned to take a cool drink. Sometimes there was a pretty squirrel frisking about among the trees.

After a pleasant drive they reached home, and Clara jumped from the buggy and ran to the barn in search of Grandfather and Uncle Don, while

This is Grandma Donahoe of Pennsylvania and her grandchildren. Ruth is in her arms; the two in the middle are Sarah and Ruth Armstrong, while Wilda and Velma are in the front.

the hired man put old Ned into his stall, and Grandmother went into the house to prepare supper.

"Hello, Clara!" said Uncle Don, as his little niece suddenly appeared in the doorway. Then Grandfather gave her a real bear hug.

"Are you going to milk the cows," asked Clara, as Uncle Don left the barn.

"Yes, but I don't believe you can milk a cow," said he, with a merry twinkle in his eye.

"Yes, I can," said Clara, "you just wait until I get my old dress on."

"Gracious, that supper smells good," said she, as she went into the house. "I'm going to help milk the cows, Grandmother."

Grandmother smiled kindly at her as she ran out to the stable. "Uncle Don, which cow shall I milk?"

"I think you may feed the calf instead," replied her uncle. So he gave her a pail of milk and told her to hold on real tight while the calf drank.

(To be continued.)

PRIZE WINNERS

Coloring Japanese Lady

Charles Ernst, Emily Chafey Longstreet, Helen Yetter, Virginia Mae Resler, Lull May Miller, Alice Miller, Flett, L. B. Birtle, L. Birtle, Charles Green, C. C. Christmas, Mary McCall.

Drawing Cow

PASSING EVENTS IN PICTURES

1

2

3

4

5

1. Goodbye caps! Here are 400 newly commissioned ensigns tossing away their midshipmen's caps at the end of graduation exercises at the U. S. Naval Academy, Annapolis, Md.

2. The Turks like her. Five-year-old Baby Fatma hails from Rodosto on the Sea of Marmora. She is Turkey's most popular movie star.

3. You will see this bird guarding the new Soldiers' and Sailors' Memorial Bridge which leads across the railroad tracks to the State Capitol at Harrisburg. It is one of a pair of 200-ton limestone eagles, 22 feet high.

4. Freezing corn in August. U. S. Department of Agriculture experimenters lower this portable electric refrigerator over hills of growing corn to learn which varieties can survive a sudden fall freeze.

5. A rip-snorter in action. This remarkable picture shows a Nebraska tornado in the act of destroying the homes of several hundred people.

Each task seems easier . . . costs less . . . with a **FORDSON**

TAKE plowing, for instance. With a Fordson Agricultural Tractor, you can make the most of those ideal plowing days that are all too rare . . . when the soil is neither too wet nor too dry to turn best.

You'll appreciate your Fordson for the multitude of other jobs, where it helps speed up the work, makes it possible to start and finish at the *right time*.

Ample power . . . power you can depend on . . . is one feature of the Fordson Tractor. With a 4-cylinder engine, which develops 30 belt horse-power at 1100 r.p.m., the Fordson will plow at $3\frac{1}{4}$ miles an hour with a two-bottom, 14-inch plow.

Another feature is the ignition-system, which uses a high-tension magneto equipped with an impulse-starter coupling. This improvement greatly facilitates starting, and eliminates all danger of the engine's kicking back when it is cranked.

Another is the extra weight in the front end, resulting from new, heavier front wheels. Others are the new centrifugal pump in the cooling system; new lubrication-system which has a large oil-filter screen in the crankcase; air-washer, which has been enlarged to ample capacity for a full day's running; redesigned transmission; improved gasoline carburetor; hot-spot manifold; sixteen-plate transmission-brake; heavy fenders; steel steering-wheel, hard-rubber covered; shock-absorbing front coil-spring; and crankcase ventilation.

You will find the improved Fordson ideally adapted to all farm jobs. Your Fordson dealer will gladly arrange a demonstration.

Rugged construction throughout characterizes the Fordson Tractor engine. Pistons and connecting-rods are weighed and matched in sets to give perfect balance.

The rear axle is designed for heavy duty. It is equipped throughout with large roller bearings, adding to its life and reducing friction.

The capacity of the air-washer has been increased from 7 to 17 quarts of water. This additional capacity gives more satisfactory operation, and makes refilling much less frequent.
